## Documentation updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent software updates, go to https://downloads.autonomy.com/productDownloads.jsp.
To verify that you are using the most recent edition of a document, go to https://softwaresupport.hpe.com/group/softwaresupport/search-result?doctype=online help.
This site requires that you register for an HPE Passport and sign in. To register for an HPE Passport ID, go to https://hpp12.passport.hpe.com/hppcf/login.do.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HPE sales representative for details.

## Support

Visit the HPE Software Support Online web site at https://softwaresupport.hpe.com.
This web site provides contact information and details about the products, services, and support that HPE Software offers.

HPE Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Access product documentation
- Manage support contracts
- Look up HPE support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HPE Passport user and sign in. Many also require a support contract.

To register for an HPE Passport ID, go to https://hpp12.passport.hpe.com/hppcf/login.do.
To find more information about access levels, go to
https://softwaresupport.hpe.com/web/softwaresupport/access-levels.
To check for recent software updates, go to https://downloads.autonomy.com/productDownloads.jsp.

## About this PDF version of online Help

This document is a PDF version of the online Help.
This PDF file is provided so you can easily print multiple topics or read the online Help.
Because this content was originally created to be viewed as online help in a web browser, some topics may not be formatted properly. Some interactive topics may not be present in this PDF version. Those topics can be successfully printed from within the online Help.

- Licenses .......................................................................................................................... 22

## About Eduction

Eduction is a tool that you can use to identify and extract an entity (a word, phrase, or block of information) from text, based on a pattern you define. The entities are contained inside grammar files.

Eduction includes standard grammar files, which allow you to quickly and easily extract commonly sought entities, such as social security numbers, names, telephone numbers, addresses, and so on.

Eduction also contains sentiment grammar files that enable you to identify positive or negative sentiments in text.

## Eduction Architecture

Figure 1 shows the basic Eduction architectural flow for extracting entities from a document when Eduction is used with IDOL. For information about the individual components for Eduction SDK, see Eduction Components, on page 15.

Figure 1: IDOL Eduction workflow

Figure 2 shows the Eduction components used when programming with the Eduction SDK. For information about the individual components for Eduction, see Eduction Components, on page 15.

Figure 2: Eduction SDK workflow

Figure 3 shows how you can perform extraction by using the Eduction grammar and the Eduction ACI server. For information about the individual components for Eduction, see Eduction Components, on page 15 .

Figure 3: Extraction using the Eduction ACI Server

Figure 4 shows the workflow if you want to use the edktool command-line tool to compile and test grammar files, list entities, extract entitles, and so on. For more information see edktool Command-Line Tool, on page 85.

Figure 4: edktool workflow

## Eduction Components

Eduction consists of the following components:

- Eduction Engine. The core logic in Eduction that supports the extraction of predefined entities from text, using Eduction grammar files compiled from XML source.
- Command-line tool (edktool). edktool compiles grammar files, performs extraction from the command line, lists entities in a grammar file, and tests the accuracy of the extraction. See edktool Command-Line Tool, on page 85. A separate edktool.cfg configuration file contains edktool settings.
- Standard grammars. A collection of ECR grammar files covering commonly sought entities such as Social Security numbers, postal addresses, telephone numbers, people names, and so on. See Standard Grammars, on page 127.
You can license standard grammar files by category and by language, so that it is possible to be licensed for any combination of category (for example, sentiment, place, or person) and language. The license is now required when using edktool to compile any grammar files that use the standard grammars as resources, as well as for extraction.
- User grammar. XML files created by the user that describe entities that can locate patterns in text using the Eduction grammar language. See Grammar Reference, on page 297.
- Eduction tasks in CFS. You can use the Connector Framework Server (CFS) to manipulate and enrich documents in a variety of ways, including performing Eduction on document fields, using Lua scripts to run Eduction processing and post-processing tasks, and redacting information in documents. For more information, see the Connector Framework Server Administration Guide.
- Eduction SDK. This is the C and Java programming interface for Eduction.

For information on the IDOL configuration file for the Eduction module, refer to the IDOL Eduction User Guide*.

For information on the IDOL configuration file for the ACI server, see Eduction ACI Server, on page 69.

- Eduction ACI server (eductionserver). This component is a stand-alone Eduction server, included in the SDK and typically used with the LSA grammar to identify sentiment in passages of text. The eductionserver. cfg configuration file contains the settings for the Eduction server.
* Not all distributions of Eduction contain this component.

## Common Use Scenarios

The following scenarios describe possible use cases for Eduction:

- Use edktool to compile grammars, and test extraction on IDX, XML, or plain text documents.
- Use the Eduction ACI server from a browser to identify employee names in a document.
- Use Eduction to extract and compile a list of product names or company names from your data.
- Use Eduction as a preprocessing tool to automatically extract entities from your documents and add them as metadata to your documents before indexing.
- Use Eduction to extract common search phrases from documents before indexing, and tag the documents with this data.
- Set up an Eduction task to extract different parts of your documents to different fields. For example, if your documents are letters, you can extract the name, address, and date from each document into predefined fields.
- Use Eduction to extract information from the results of Optical Character Recognition.
- Use the redaction feature to conceal sensitive information in your output, so that you can conform to data protection standards and use your records for multiple purposes.

The Eduction architecture supports the extraction of:

- common entities, including place, personal names, and companies.
- any basic entities you define using dictionaries or grammars.
- complex entities you define (facts, events, relationships, and so on).

## Eduction Concepts

This section introduces some of the Eduction concepts and terminology used throughout this guide.

- Dictionaries ................................................................................................................................. 17
- Grammars .......................................................................................................................... 17
- Linguistic Sentiment Analysis .................................................................................................. 18
- Perform Sentiment Analysis on Short Comments ................................................................. 19
- Components ............................................................................................................. 20

- Results Relevance .................................................................................................................... 21
- Case Sensitive Matches ........................................................................................................ 21
- Case Insensitive Match Performance ...................................................................................... 22
- When to Configure Case Sensitivity ................................................................................... 22
- Case Sensitivity and Configured Field Names ............................................................. 22

## Dictionaries

In Eduction, a dictionary is a file that provides a vocabulary for a simple entity, such as cities or countries. The dictionaries are organized by a list of headwords (simple or compound). Each headword can also have a set of associated words called synonyms. Eduction uses the dictionary to scan a document and extract the defined entities that match the search pattern.

Dictionaries are written in XML and included in a grammar file.

## Grammars

A grammar is a file that provides rules for complicated entities such as URLs or postal addresses. The entities can be recursively defined. Rules can refer to entities in external grammars and dictionaries. Eduction uses the grammar to scan a document and extract the defined entities that match the search pattern.

The pattern can be a dictionary of names such as people or places, or the pattern can describe what the sequence of text looks like without having to list it explicitly, for example, a telephone number, or a time.

Grammars are written in XML and the regular expression format. Eduction supports context-free grammars.

Eduction also allows you to extend existing grammars, and to author new ones, either from scratch or by referencing existing entities. For more information about how and when to extend your grammars, and how to improve the recall of your grammar files, refer to IDOL Expert.

## Linguistic Sentiment Analysis

The sentiment analysis grammar files contain dictionaries of types of word (for example, positive adjective, negative noun, neutral adverb, and so on), and patterns that describe how to combine these dictionaries to form positive and negative phrases.

For example, you could run sentiment extraction using the English sentiment grammar file (sentiment_ eng.ecr), with the following hotel review as the input file:

The room was nice enough, with a plug in radiator, tv with an English news channel, hot shower, comfy bed. The receptionist we first dealt with was miserable and rude, and just grunted at us and rolled her eyes because we were too early for check in having just got off the morning train from Khabarovsk. Fortunately, a younger receptionist with a nice smile appeared, spoke to us helpfully suggesting a few cafes nearby to pass some time, and we tried to forget about the other woman. Breakfast is terrible. Unidentifiable cordials, gloomy porridge, bread rolls filled with things you don't expect for breakfast, like potato, egg and dill. Don't come here for the breakfast, but for the cost of the room in a city like Vladivostok, the hotel is still decent value for money.

The following is a sample of the output that this produces:

```
<?xml version="1.0" encoding="UTF-8"?>
    <MATCHLIST>
        <DOCUMENT Type="IDOL IDX" ID="Unknown">
            <FIELD Name="DRECONTENT">
                <FIELD_INSTANCE Value="1">
                <MATCH EntityName="sentiment/positive/eng" Offset="7" OffsetLength="5"
                Score="1.05" NormalizedTextSize="17" NormalizedTextLength="17"
                OriginalTextSize="17" OriginalTextLength="17">
                <ORIGINAL_TEXT>The room was nice</ORIGINAL_TEXT>
                <NORMALIZED_TEXT>The room was nice</NORMALIZED_TEXT>
                <COMPONENTS>
                        <COMPONENT Name="TOPIC" Text="The room" Offset="0"
                    OffsetLength="0" TextSize="8" TextLength="8"/>
                        <COMPONENT Name="SENTIMENT" Text="nice" Offset="13"
                        OffsetLength="13" TextSize="4" TextLength="4"/>
                </COMPONENTS>
                </MATCH>
                <MATCH EntityName="sentiment/negative/eng" Offset="494"
                OffsetLength="492" Score="1.2" NormalizedTextSize="21"
                NormalizedTextLength="21" OriginalTextSize="21"
                OriginalTextLength="21">
                    <ORIGINAL_TEXT>Breakfast is terrible</ORIGINAL_TEXT>
                    <NORMALIZED_TEXT>Breakfast is terrible</ NORMALIZED_TEXT>
                    <COMPONENTS>
                        <COMPONENT Name="TOPIC" Text="Breakfast" Offset="0"
                    OffsetLength="0" TextSize="9" TextLength="9"/>
                    <COMPONENT Name="SENTIMENT" Text="terrible" Offset="13"
```

```
                    OffsetLength="13" TextSize="8" TextLength="8"/>
                </COMPONENTS>
            </MATCH>
        </FIELD_INSTANCE>
        </FIELD>
    </DOCUMENT>
</MATCHLIST>
```

The following example configuration shows the recommended usage:

```
[Eduction]
ResourceFiles=grammars/sentiment_eng.ecr
// Note: replace sentiment_eng.ecr by sentiment_user_eng.ecr if using user
modification
// standard entities for all sentiment analysis in English:
Entity0=sentiment/positive/eng
Entity1=sentiment/negative/eng
EntityField0=POSITIVE_VIBE
EntityField1=NEGATIVE_VIBE
EntityComponentField0=TOPIC,SENTIMENT
EntityComponentField1=TOPIC,SENTIMENT
// some invalid matches are given very low scores so that we can filter them out:
MinScore=0.1
// for extraction of Twitter handles, hashtags and emoticons:
TangibleCharacters=@#:;
// for displaying metadata:
OutputScores=True
OutputSimpleMatchInfo=False
EnableComponents=True
```

For more information on the sentiment analysis grammar files, how to adjust the sentiment analysis by extending the grammars, and the features that the sentiment grammars support, refer to IDOL Expert.

## Perform Sentiment Analysis on Short Comments

The standard sentiment analysis grammars are designed for high precision. For some sources of short comment data, such as YouTube comments, no positive or negative matches are found in some documents despite sentiment clearly being expressed.

If recall with the full sentiment_eng.ecr grammar file is too low, and your documents are generally short comments, use sentiment_basic_eng.ecr to extract additional matches. This grammar contains carefully-selected lists of positive and negative terms that help determine the sentiment of a document in which sentiment_eng.ecr found no matches.
sentiment_basic_eng.ecr contains terms in title case, but research shows that for most data these impair recall, so these are given a lower score. HPE recommends that you set EntityMinScoreN to 0.4 to filter out these terms unless you need them.
sentiment_basic_eng.ecr does not expose TOPIC or SENTIMENT components, and does not use scores to reflect strength or reliability of polarity. The following additional example configuration shows the recommended usage:

```
[Eduction]
ResourceFiles=grammars/sentiment_eng.ecr,grammars/sentiment_basic_eng.ecr
// optional further layer of analysis for very short documents:
Entity2=sentiment/basic_positive/eng
Entity3=sentiment/basic_negative/eng
EntityField2=BASIC_POSITIVE_VIBE
EntityField3=BASIC_NEGATIVE_VIBE
// remove this setting to include basic matches in titlecase - this is not
recommended because on most data it decreases precision:
EntityMinScore2=0.4
EntityMinScore3=0.4
```

## Components

Some of the standard grammar files contain components, which enable you to extract attributes from matched phrases, such as topic, subject, and positive or negative sentiments. The attributes are called components because they are the components of a single match.

For example, if you used sentiment analysis to match the phrase Their service is fantastic as conveying positive sentiment, you can then use components to identify service as the subject matter, and fantastic as the adjective that describes the subject (note that the sentiment is not necessarily an adjective in all cases). You can also set up components when you write your own custom grammar files.

## NOTE:

sentiment_basic_eng.ecr does not support the TOPIC or SENTIMENT components.
For more information on how to configure and define components in your grammar files, and when to use them, refer to IDOL Expert.

## Related Topics

- EntityComponentFieldN, on page 109

## Extraction

Eduction extracts entities from documents based on the rules you have created in your dictionaries and grammars. Eduction can output files in multiple formats using edktool.

For each nominated field in a document, Eduction identifies each instance of the requested entity. Eduction returns an XML list of matches, or adds the matches to the source document as new fields. Eduction can also identify components of an entity match, such as:

- the parts of a social security number or phone number.
- a confidence score for the accuracy of the match.

## Results Relevance

Eduction returns entities based on the extraction rules from the grammars and dictionaries. Eduction provides a test mode to measure extraction relevance precision and recall. Precision and recall are based on the comparison between human-marked results and engine-marked results. The following terms describe result relevance as used in Eduction.

- True Positives (TP). Human-marked results that are also marked by the engine. These results specify that an entity returned by the engine has also been marked as true by the person marking the document.
- False Positives (FP). Engine-marked results that are not marked by a human. These results specify that an entity returned by the engine has not been marked as true by the person marking the document.
- True Negatives (TN). Results that are not marked either by the person marking the document, or the engine.
- False Negatives (FN). Human-marked results that are not marked by the engine. These results specify that an entity not returned by the engine has been marked as true by the person marking the document.

From these relevance terms, you can determine precision and recall as follows:

- Recall is the percentage of true relevant entities that are extracted by an extraction rule, that is,

```
TP / (TP + FN) * 100
```

- Precision is the percentage of extracted entities that are true entities, that is,

```
TP / (TP + FP) * 100
```

## Case Sensitive Matches

You can configure Eduction to match characters case sensitively or case insensitively. By default, it is case sensitive, which has better performance.

The simplest way to match case insensitively is to disable the MatchCase configuration parameter (set the parameter to False in the configuration file). Alternatively, if you are creating your own custom XML grammar files, you can configure individual grammars, entities, and entries individually to be case sensitive or insensitive. If you configure case sensitivity at a lower level, it overrides the higher level settings. Additionally, if you reference the entity in another entity, it maintains its own case sensitivity setting.

Most entities in the standard grammars do not have case sensitivity set explicitly, giving you the flexibility to use case sensitivity as required in your grammars.

## NOTE:

If you design an entity for case-insensitive matching, it is important that entries in the entity have a consistent case style to ensure that all matches are extracted correctly. You should use all lower case, all upper case, or all initial capitals, but not a mixture. Eduction uses an optimization technique for case insensitive matching that might not extract every possible match if the entity is not defined consistently.

## Case Insensitive Match Performance

Case sensitive matching generally has better performance than case insensitive matching. If you require case insensitive matching, you can use case normalization to give the same performance as case-sensitive matching.

When you want to use case normalization:

- Do not set case sensitivity explicitly in grammars and entities.
- Set the MatchCase configuration parameter to True.
- Create all entries in your entities in either all lower case, or all upper case.
- Set CaseNormalization to:
- LOWER if all your entities are lower case
- UPPER if all your entities are upper case.

Eduction normalizes the input data accordingly before the (case sensitive) matching. This process means that both your input and grammars are all in the same case, so the matching is effectively case insensitive, with the performance benefits of case sensitive matching.

## When to Configure Case Sensitivity

HPE recommends that you always create and use Eduction grammars that allow you to do case sensitive matching, because it has better performance. Most of the standard grammars come with entities using common and appropriate case styles. Some also have different entities for different case styles. If your data uses a consistent case, it is unlikely that you need to use case insensitive matching.

## Case Sensitivity and Configured Field Names

You can set the CaseSensitiveFieldName configuration parameter to 1 to preserve the case and case sensitivity of configured field names in your output. See CaseSensitiveFieldName, on page 105 for more information.

## Licenses

To use HPE IDOL solutions, you must have a running HPE License Server, and a valid license key file for the products that you want to use. Contact HPE Big Data Support to request a license file for your installation.

License Server controls the IDOL licenses, and assigns them to running components. License Server must run on a machine with a static, known IP address, MAC address, or host name. The license key file is tied to the IP address and ACI port of your License Server and cannot be transferred between
machines. For more information about installing License Server and managing licenses, see the License Server Administration Guide.

When you start Eduction SDK, it requests a license from the configured License Server. You must configure the host and port of your License Server in the Eduction SDK configuration file.
You can revoke the license from a product at any time, for example, if you want to change the client IP address or reallocate the license.

## CAUTION:

Taking any of the following actions causes the licensed module to become inoperable.
You must not:

- Change the IP address of the machine on which a licensed module runs (if you use an IP address to lock your license).
- Change the service port of a module without first revoking the license.
- Replace the network card of a client without first revoking the license.
- Remove the contents of the license and uid directories.

All modules produce a license. log and a service. log file. If a product fails to start, check the contents of these files for common license errors. See Troubleshoot License Errors, on page 25.

## Display License Information

You can verify which modules you have licensed either by using the IDOL Admin interface, or by sending the LicenseInfo action from a web browser.

## To display license information in IDOL Admin

- In the Control menu of the IDOL Admin interface for your License Server, click Licenses.

The Summary tab displays summary information for each licensed component, including:

- The component name.
- The number of seats that the component is using.
- The total number of available seats for the component.
- (Content component only) The number of documents that are currently used across all instances of the component.
- (Content component only) The maximum number of documents that you can have across all instances of the component.
The Seats tab displays details of individual licensed seats, and allows you to revoke licenses.

## To display license information by sending the Licenselnfo action

- Send the following action from a web browser to the running License Server.
http://LicenseServerHost:Port/action=LicenseInfo
where:
LicenseServerHost is the IP address of the machine where License Server resides.

```
Port is the ACI port of License Server (specified by the Port parameter in the
                        [Server] section of the License Server configuration file).
```

In response, License Server returns the requested license information. This example describes a license to run four instances of IDOL Server.

```
<?xml version="1.0" encoding="UTF-8" ?>
<autnresponse xmlns:autn="http://schemas.autonomy.com/aci/">
    <action>LICENSEINFO</action>
    <response>SUCCESS</response>
    <responsedata>
            <LicenseDiSH>
            <LICENSEINFO>
                <autn:Product>
                        <autn:ProductType>IDOLSERVER</autn:ProductType>
                        <autn:TotalSeats>4</autn:TotalSeats>
                        <autn:SeatsInUse>0</autn:SeatsInUse>
            </autn:Product>
            </LICENSEINFO>
        </LicenseDiSH>
    </responsedata>
</autnresponse>
```

## Configure the License Server Host and Port

Eduction SDK is licensed through HPE License Server. In the Eduction SDK configuration file, specify the information required to connect to the License Server.

## To specify the license server host and port

1. Open your configuration file in a text editor.
2. In the [License] section, modify the following parameters to point to your License Server.

LicenseServerHost The host name or IP address of your License Server.
LicenseServerACIPort The ACI port of your License Server.
For example:
[License]
LicenseServerHost=licenses
LicenseServerACIPort=20000
3. Save and close the configuration file.

## Revoke a Client License

After you set up licensing, you can revoke licenses at any time, for example, if you want to change the client configuration or reallocate the license. The following procedure revokes the license from a component.

## To revoke a license

1. Stop the HPE solution that uses the license.
2. At the command prompt, run the following command:

InstallDir/ExecutableName[.exe] -revokelicense -configfile cfgFilename
This command returns the license to the License Server.
You can send the LicenseInfo action from a web browser to the running License Server to check for free licenses. In this sample output from the action, one IDOL Server license is available for allocation to a client.

```
<autn:Product>
    <autn:ProductType>IDOLSERVER</autn:ProductType>
    <autn:Client>
        <autn:IP>192.123.51.23</autn:IP>
        <autn:ServicePort>1823</autn:ServicePort>
        <autn:IssueDate>1063192283</autn:IssueDate>
        <autn:IssueDateText>10/09/2003 12:11:23</autn:IssueDateText>
    </autn:Client>
        <autn:TotalSeats>2</autn:TotalSeats>
        <autn:SeatsInUse>1</autn:SeatsInUse>
</autn:Product>
```

## Troubleshoot License Errors

The table contains explanations for typical licensing-related error messages.

## License-related error messages

| Error message | Explanation |
| :--- | :--- |
| Error: Failed to update license from the <br> license server. Your license cache details do <br> not match the current service configuration. <br> Shutting the service down. | The configuration of the service has been <br> altered. Verify that the service port and IP <br> address have not changed since the service <br> started. |
| Error: License for ProductName is invalid. <br> Exiting. | The license returned from the License Server is <br> invalid. Ensure that the license has not expired. |
| Error: Failed to connect to license server <br> using cached licensed details. | Cannot communicate with the License Server. <br> The product still runs for a limited period; <br> however, you should verify whether your <br> License Server is still available. |
| Error: Failed to connect to license server. <br> Error code is SERVICE: ErrorCode | Failed to retrieve a license from the License <br> Server or from the backup cache. Ensure that <br> your License Server can be contacted. |
| Error: Failed to decrypt license keys. Please <br> contact Autonomy support. Error code is <br> SERVICE:ErrorCode | Provide HPE Big Data Support with the exact <br> error message and your license file. |

License-related error messages, continued

| Error message | Explanation |
| :--- | :--- |
| Error: Failed to update the license from the <br> license server. Shutting down | Failed to retrieve a license from the License <br> Server or from the backup cache. Ensure that <br> your License Server can be contacted. |
| Error: Your license keys are invalid. Please <br> contact Autonomy support. Error code is <br> SERVICE:ErrorCode | Your license keys appear to be out of sync. <br> Provide HPE Big Data Support with the exact <br> error message and your license file. |
| Failed to revoke license: No license to revoke <br> from server. | The License Server cannot find a license to <br> revoke. |
| Failed to revoke license from server <br> LicenseServer Host.LicenseServerPort. Error <br> code is ErrorCode | Failed to revoke a license from the License <br> Server. Provide HPE Big Data Support with the <br> exact error message. |
| Failed to revoke license from server. An <br> instance of this application is already running. <br> Please stop the other instance first. | You cannot revoke a license from a running <br> service. Stop the service and try again. |
| Failed to revoke license. Error code is <br> SERVICE:ErrorCode | Failed to revoke a license from the License <br> Server. Provide HPE Big Data Support with the <br> exact error message. |
| Your license keys are invalid. Please contact <br> Autonomy Support. Error code is <br> ACISERVER:ErrorCode | Failed to retrieve a license from the License <br> Server. Provide HPE Big Data Support with the <br> exact error message and your license file. |
| Your product ID does not match the generated | Your installation appears to be out of sync. <br> Forcibly revoke the license from the License <br> Server and rename the license and uid <br> directories. |
| ID. | The service port for the module or the IP <br> address for the machine appears to have <br> changed. Check your configuration file. |
| Your product ID does not match this <br> configuration. |  |

## Chapter 2: Deploy Eduction SDK

This chapter describes the files in the Eduction SDK and how to deploy the SDK. It contains the following sections:

- Eduction SDK ........................................................................................................................... 27
- Eduction SDK Installation .................................................................................................. 27
- Eduction Server ............................................................................................................................. 27
- C API Component .................................................................................................................. 28
- Java API Component ................................................................................................ 29

## Eduction SDK

The Eduction SDK includes the following components:

- Eduction SDK Programming Guide
- Standard collection of grammar files covering a range of commonly used entities
- edktool command-line tool used for compiling Eduction XML source grammar files into compiled run-time ECR files
- Eduction Server
- C API
- Java API

## Eduction SDK Installation

Use the following procedure to install Eduction SDK.

## To install Eduction SDK

1. Go to the Download Center on the Customer Support site.
2. Download the latest Eduction SDK .zip file for your platform:

EductionSDK_<VersionNumber>_<PLatform>.zip
3. Copy the .zip file to a location on your local machine, and unzip it.

## Eduction Server

Eduction Server is an ACI server, and requires a configuration file to run. A sample configuration file is provided with Eduction SDK. To run Eduction Server, you must update this configuration file with the host and port details of your HPE License Server.

## Start and Stop Eduction Server

- If you are running Eduction Server on Windows, you can install the server as a Windows service. After you have installed the server as a service, you can start and stop the service from the Windows Services manager.
- If you are running Eduction Server on Linux and UNIX, you can use the StartEductionServer. sh and StopEductionServer. sh shell scripts to start and stop Eduction Server.

## C API Component

The C API component of the Eduction SDK includes:

- The Eduction header file (edk.h).
- The Eduction SDK library linker file (edk. lib), Windows only.
- The Eduction SDK library on Windows (edk.dll) or shared object on UNIX (libedk. so).
- Several sample C programs that demonstrate various SDK features.

Solution files and project files are provided for Visual Studio 2010.
To use the Eduction SDK in C, include the edk. h header file from your C source code and link with the SDK library. A sample makefile is provided showing how to compile and link to the SDK.

## NOTE:

On Windows, you must specify the Eduction library in the PATH environment variable. On UNIX, the shared object must be in the library search path.

## Build the Sample Programs

You can use the sample programs to validate that the Eduction EDK compiles, links, and runs correctly.

## UNIX

Use the following procedure to build the sample programs on UNIX.

## To build the sample programs on UNIX

1. Navigate to the c_api/test directory.
2. Set the PLATFORM environment variable (refer to the makefile for more details).
3. Run make dir=ext.

The resulting binaries require that the shared object be in the library search path. By default, this is not the case, so a Perl script is provided to add the shared object to the search path by setting LD_ LIBRARY_PATH. The script then runs the test binary. To run the script, use the following command:
perl runtestedk.pl ext

The Perl script expects a valid Eduction OEM license key with the name licensekey. dat to be located in the test directory. If the test works correctly, you see a line of text in the output beginning with the string PASS:, otherwise you see the string FAIL:

## Windows

To build the test executable binaries, a Visual Studio 2010 solution file, test. sln, is provided in the test folder.

The resulting binaries require that the edk. dll be in the library search path. By default, this is not the case, so a Perl script is provided to add the library to the search path and then run the test binary. To run the script, use the following command:

```
perl runtestedk.pl ext
```

The Perl script expects a valid Eduction OEM license key with the name licensekey. dat to be located in the test directory. If the test works correctly, you see a line of text in the output beginning with the characters PASS:, otherwise you see FAIL:.

## Java API Component

The Java API component of the Eduction SDK includes:

- The Eduction library on Windows (edkjni.dll) or shared object on UNIX (libedkjni.so).
- The Java JAR file (edk. jar).
- Java code samples that you can compile and execute by using the Eduction SDK. These samples are located in the \src \com\autonomy \eduction\test \directory of the Eduction SDK root directory, and are named SampleN. java (Sample1.java, Sample2.java, and so on). Each SampleN. java file illustrates aspects of SDK functionality, and contains detailed descriptions of the functionality in question. For information on how to compile and run Sample1.java, see Build and Run the Sample Programs, below.

NOTE:
Before you follow the instructions on how to compile and run Sample1. java, you must copy the licensekey. dat file into the test subfolder of your Eduction SDK installation. You must perform all command-line operations from the Eduction SDK installation directory.

## NOTE:

On Windows, you must specify the Eduction library in the PATH environment variable. On UNIX, the shared object must be in the library search path.

## Build and Run the Sample Programs

Use the following procedure to build and run the sample programs.

## To build and run the sample programs

1. Navigate to the java_api directory.
2. Run ant all.

Programming Guide

## Chapter 3: API Reference

This chapter describes the C and Java APIs for Eduction SDK, and contains the following sections:

- C API Reference ..................................................................................................................... 32
- C API Examples ...................................................................................................... 33
- Java API Concepts ................................................................................................................. 65
- Java API Reference ......................................................................................................... 66
- Java API Example .......................................................................................................... 67

## C API Concepts

This section describes concepts required to implement C language applications for Eduction SDK.

## Include Files

The Eduction SDK C API uses the edk.h include file. This include file contains the core APIs for the Eduction SDK engine.

## Naming Conventions

The types, functions, and macros specific to Eduction SDK are prefixed with the string Edk.

## Concurrency Control

Concurrency in Eduction is handled using sessions. An instance of an EDKEngine is initialized with corresponding grammars for entity extraction. Each such engine can be associated with one or more sessions. All the sessions in the engine share the same grammars. The engine must be configured fully before any sessions are created.

After you create a session, an EdkError is thrown if you change the engine settings. However, each individual session can process many documents or streams. Each session maintains its state independent of others. Each engine must be associated with at least one session by default.

## Standalone API Usage

The Eduction Software Development Kit (SDK) C API allows C developers to interact directly with the Eduction engine.

At the core of the API is an eduction engine. The first call of the API in an application should create the engine. You must then set a valid license for the engine.

After you create it, you can optionally configure an engine to determine its matching behavior. You must load one or more resource files that contain the eduction grammars, and you must add one or more entities, from the loaded resource files, to match against.

Data processing is performed in an eduction session. You can create multiple sessions for each eduction engine. All sessions use the same loaded grammars and entities. Each session maintains its own state so that the sessions can run concurrently in a multithreaded application.

You can use the session to process multiple documents. You can pull (stream) or push (add) data. You call a function to get the next available match. You can call this function repeatedly to cycle through all the matches. For each match, you can access the associated text and properties by using several function calls.

You can keep a session alive for as long as necessary. However, you must destroy it before you destroy the engine that is associated with it. The call to destroy the engine should be the last call of this API in an application.
This section describes the skeletal structure of a stand-alone application using the API. See the source code in C API Examples, on the next page. Typically, your application takes the following actions:

1. Include edk.h.
2. Instantiate the engine and obtain an engine handle.
3. Set the license key.
4. Configure the engine to:

- set optional parameters.
- load the grammar files to use for matching.
- add specific entities from grammars to use for matching.

5. Create a session associated with the engine, and obtain a session handle. You can create and run concurrent sessions in a multithreaded application. Each session uses the same grammars, but maintains its own state.
6. Feed UTF-8 encoded text to the session.
7. Call EdkGetNextMatch to obtain an entity match. You can call this method repeatedly to obtain all matches.
8. If required, call EdkGetRedactedText to produce redacted output.
9. For each match, get details and properties of the match.
10. To process multiple documents, repeat Step 6 to Step 9.
11. Release resources when done. You must destroy all session handles before destroying the engine handle.

## C API Reference

The C API Reference documentation is located in the following directory:
InstalLDir/c_api/help/
where InstalLDir is the directory where you have installed the Eduction SDK.

## C API Examples

This section provides sample programs that demonstrate usage of specific API functions.

- basic.c ................................................................................................................................. 33
- cjknormalization.c ......................................................................................................... 40
- postprocess.c ......................................................................................................... 46
- redaction.c ....................................................................................................................................... 55
- multithread.c .......................................................................................................................... 61

## basic.c

The basic.c program demonstrates the basic usage of the C API functions, as described in Standalone API Usage, on page 31. This program:

- creates an Eduction engine.
- configures an Eduction engine.
- associates a session with the Eduction engine.
- adds text to the session, and performs an entity extraction on the text.
- outputs the results.

To build and run the sample, navigate to the test directory in your Eduction installation, and open the text file readme.txt. This file provides specific directions on how to compile and run the sample. You must have an Eduction OEM license key to run the sample.

```
#include <stdlib.h>

## postprocess.c

The postprocess.c program builds upon basic.c and shows the work flow needed to support postprocessing in eduction. The program:

1. creates and configures an eduction engine.
2. creates post-processing tasks.
3. creates an eduction session to process the input.
4. adds input text to the session.
5. performs the extraction.
6. collects the matches from the extraction.
7. runs post-processing tasks on the matches.
8. prints the results.
9. cleans up the post-processing tasks.
```

## \}

## multithread.c

The multithread.c example program is for use on the Linux platform.
This sample program demonstrates the use of multiple eduction sessions associated with a single eduction engine running in parallel.

This program takes arguments of the names of the text files to process. The program has the following stages:

1. The program creates and configures an eduction engine.
2. The program creates a worker thread for each text file.
3. The worker thread starts with the eduction engine and the text file. This worker thread:

- creates a session associated with the eduction engine.
- adds text from the text file to the session.
- performs an entity extraction of the text.

4. The main program then waits for each thread to finish extraction, exit, and join.
```
#include <stdlib.h>
#include <stdio.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <malloc.h>
#include <string.h>
#include <pthread.h>
#include <edk.h>
/*
    * Create an app that uses multiple sessions in parallel
    * Number of sessions depends on the number of input files
    */
// Data to pass to each worker thread
typedef struct thread_data
{
    char* file;
        EdkEngineHandle engine;
} t_thread_data;
// The worker thread function
// Creates a session using the engine handle
// Processes the the input file
static void* WorkProc(void* pvArgs)
{
    t_thread_data* p = (t_thread_data*)pvArgs;
```

```

    return -1;
}
printf("INFO: Resource file loaded.\n");
// Add target entity - change if necessary
if (EdkSuccess != (error = EdkAddTargetEntity(engine, "company/name/eng")))
{
    printf("Error: Can't add entity, error cdoe = %d.\n", error);
    EdkEngineDestroy(engine);
```

```
        return -1;
    }
    printf("INFO: Entity added.\n");
    // Prepare the worker threads
    size_t nThreads = argc - 1;
    pthread_t* threadId = (pthread_t*)calloc(nThreads, sizeof(pthread_t));
    void* tmp = calloc(nThreads, sizeof(t_thread_data));
    t_thread_data* threadData = (t_thread_data*)tmp;
    int ii = 0;
    pthread_attr_t attr;
    pthread_attr_init(&attr);
    pthread_attr_setstacksize(&attr, 128000);
    pthread_attr_setdetachstate(&attr, PTHREAD_CREATE_JOINABLE);
    // Start the threads
    // Each thread uses a session to process an input file
    for(ii=0;ii<nThreads;ii++)
    {
    threadData[ii].engine = engine;
    threadData[ii].file = argv[ii + 1];
    pthread_create(&threadId[ii], &attr, WorkProc, (void*)&threadData[ii]);
    }
    // Join the threads when done
    for (ii = 0; ii < nThreads; ii++)
    {
        if (threadId[ii])
    {
        void *pvres;
        pthread_join(threadId[ii], &pvres);
    }
    }
free(threadId);
free(threadData);
EdkEngineDestroy(engine);
printf("INFO: Done\n");
return 1;
}
```

## Java API Concepts

Eduction SDK provides a Java API that enables your application to create an extraction engine and perform entity extractions.

This section describes the concepts used to write Java applications with the Eduction SDK.

The Java SDK consists of a JAR file, and a DLL (Windows) or shared object (UNIX/Linux).

- The JAR file contains the Eduction Java class library, and the interface to the Eduction Java Native Interface (JNI).
- The DLL or shared object implements the Eduction JNI library, and performs the Eduction functionality.
- Java developers can use either the Eduction JNI, the class library, or both. The JNI provides functionality almost identical to that of the Eduction C API. The class library encapsulates related JNI methods, implements exception handling, and provides return values from method calls that simplify application programming.

## Naming Conventions

The main JNI class that provides access to native functionality is EDKJNI. Support classes for the JNI are prefixed with EDKJNI, for example EDKJNIVersion.

The Eduction class library classes are prefixed with EDK, for example EDKEngine.

## Concurrency Control

Concurrency in Eduction is handled using sessions, represented by an EDKSession object. An instance of an EDKEngine object is initialized with corresponding grammars for entity extraction. Each such engine can be associated with one or more sessions. All the sessions in the engine share the same grammars. The engine must be configured fully before any sessions are created.

After a session is created, engine settings cannot be changed, or an exception is thrown. However, each individual session can process many documents or streams. Each session maintains its state independent of others. Each engine must be associated with at least one session by default.

## Standalone API Usage

This section describes the basic structure of a stand-alone application using the API. See the source referenced in Java API Example, on the next page. Typically, your application takes the following actions:

1. Instantiate an EDKEngine object.
2. Set the license key.
3. Configure the engine, load the grammars and select entities.
4. Instantiate an EDKSession object and associate it with the engine.
5. Feed UTF-8 encoded text to the session or pass the session a stream it can read.
6. Execute a for each loop to obtain an EDKMatch object for each match in a session.
7. Get the properties of the match.
8. Release resources when done.

## Java API Reference

The Java API Reference documentation is located in the following directory:

InstalLDir/java_api/help
where InstalLDir is the directory where you have installed the Eduction SDK.

## Java API Example

The Eduction Java API includes sample programs that illustrate basic Eduction Java API usage. The samples are located in the src/com/autonomy/eduction/test folder. The samples are documented inline and are also described in the HTML documentation.

For information on how to build and run the sample programs, see Build and Run the Sample Programs, on page 29.

Programming Guide

## Chapter 4: Eduction ACI Server

This section describes the Eduction ACI Server.

- Introduction to Eduction ACI Server ..... 69
- Command-Line Options ..... 69
- Configuration File Settings ..... 70
- Include an External Configuration File ..... 76
- Lua Post-Processing ..... 78
- Server Actions ..... 81

## Introduction to Eduction ACI Server

The Eduction ACI Server is a standalone server based upon the HPE ACI server. The Eduction Server processes UTF-8 encoded text, matching upon entities defined in Eduction grammars. Results return as XML, with tags in the HPE ACI hierarchy. You define the grammars to load and the entities to match on using a configuration file. Every time you send a query, the server creates a new engine with the grammars and entities that you specified.

You can make requests from a browser or ACI client. Browsers can make requests to process small amounts of text using an HTTP GET request, or larger amounts using an HTTP POST request.

You can specify configuration settings as query parameters to override the settings in the configuration file for individual queries. See Select Entities at Runtime, on page 82 for more information.

## Command-Line Options

Usage: eductionserver [options]

| Options | Description |
| :--- | :--- |
| -version | Displays the program version. This option must be the only argument. The program <br> ends after the version information is displayed. |
| directory | Sets the working directory. The Eduction ACI server starts from this directory. All <br> other arguments used in the command line are relative to this directory. |
| -configfile <br> file | Sets the configuration file name. This option overrides the default configuration file <br> name of eductionserver.cfg. |
| - <br> revokelice <br> nse | Revokes a lock on the Eduction license from the HPE License Server. |
| -install | Installs Eduction as a service (Windows only). Syntax: |

| Options | Description |
| :--- | :--- |
|  | -install [-start auto\|manual \|disabled] [-username username] [- <br> password password] <br> The -start option allows you to specify the startup mode. By default, it is <br> automatic. If you do not supply a user name and password, Eduction runs under a <br> local account. |
| -uninstall | Uninstalls the Eduction service. |

## NOTE:

Options are case sensitive.

## NOTE:

On Linux, the ACI server requires the C++ library, libstdc++. so. To ensure the server can locate the required library, set the Library Path:

```
setenv LD_LIBRARY_PATH bin:$LD_LIBRARY_PATH
```

## Configuration File Settings

The Eduction ACI Server requires a configuration file, which identifies settings required for the server to run. The default configuration file is eductionserver.cfg. You can change the configuration file by using command-line options. See Command-Line Options, on the previous page.
See Eduction Parameters, on page 100 for more information.

## NOTE:

Some configuration settings affect extraction speed, for example MatchCase, MatchWholeWords, AllowOverlaps, and NonGreedyMatch. For more information on factors that can affect Eduction performance, refer to IDOL Expert.

## Eduction ACI Server Configuration Parameters

## Required Parameters

## [Eduction]

ResourceFiles=GrammarFile [,GrammarFile2]...

The name of one or more Eduction grammar files to load. The grammar files contain the entities to use to match text.
You can specify multiple grammar names as a commaseparated list, by using wildcard expressions, or by specifying a comma-separated list of multiple wildcard expressions. There must be no space before or after a comma.

## NOTE:

Because all entities loaded to an engine must have unique names, you must not load the same grammar file more than once.

| Eduction ACI Server Configuration Parameters |  |
| :---: | :---: |
| EntityN=entity | The name of an Eduction entity, contained in the loaded grammar files. When you pass text to Eduction, it matches on the entity. <br> $N$ must start at zero, and increase by one for each entity you list. For example, Entity0, Entity1, and so on. <br> This parameter supports wildcard expressions. <br> NOTE: <br> All entities must have unique names. |
| Recommended Parameters |  |
| [Eduction] |  |
| AllowDuplicates | A list of IDOL fields in which to allow duplicate entities. You can enter multiple fields separated by a comma. |
| AllowMultipleResults | Set this parameter to All or True to allow Eduction to return multiple matches starting at the same offset. <br> Set this parameter to No or False to allow Eduction to return only one match starting at each offset. <br> Set this parameter to OnePerEntity to allow Eduction to return up to one match starting at the same offset per entity. |
| AllowOverlaps=[False\|True] | Whether to allow Eduction to return more than one match when multiple matches involve overlapping text. |
| CantHaveFieldCSVs | Names of fields that Eduction ignores when reading an XML file. Allows you to specify the fields in documents that are discarded before the documents are stored. |
| CaseNormalization= [Upper\|Lower] | Converts the case of incoming text to all uppercase or all lowercase. By default, Eduction does not perform any case conversions. |
| CaseSensitiveFieldName | Whether to preserve the case sensitivity of configured field names. By default, the Eduction module converts all field names to uppercase when it produces matches. Set this parameter to True to preserve the case of the field names. This option makes field names case sensitive. |
| CJKNormalization | Whether to normalize Chinese, Japanese, and Korean data before extraction. Set this parameter to one of the following: <br> - Kana <br> - OldNew <br> - Number |

## Eduction ACI Server Configuration Parameters

|  | - HWNum <br> - HWAlpha <br> - SimpChi <br> - FWJamo <br> See CJKNormalization, on page 106 for more information. |
| :---: | :---: |
| Databases | The names of the databases to which a document belongs. Eduction runs only on documents that belong to the commaseparated list of databases. If you do not list databases, Eduction is run on documents from all databases. |
| DocumentDelimiterCSVs | File fields (tags) marking the start and end of a document. |
| EnableComponents=[False\|True] | Whether to output component details in the match results, when grammars define components in an entity. <br> This parameter is used by edktool only, and is ignored by Eduction. |
| EnableUniqueMatches | Whether to return only unique matches in each document. If you set this parameter to True, Eduction returns a single occurrence of a particular value. If the same value occurs more than once, only the first instance is returned, even if the matches occur for different entities. |
| EntityAdvancedFieldN | A comma-separated list of advanced fields to return. <br> To use this option you must: <br> - set OutputSimpleMatch to False for edktool. <br> - set EnableComponents to True for edktool. <br> - define components in the entity definition. |
| EntityComponentFieldN | A comma-separated list of entity components that you want to return as fields. <br> To use this option you must: <br> - set OutputSimpleMatch to False for edktool. <br> - set EnableComponents to True for edktool. <br> - define components in the entity definition. |
| EntityMatchRangeN | A range of matching instances of the entity that are returned. The entity match range number $N$ must match the corresponding EntityN number. The format of the range is as follows: <br> <match>$\{-\\|, \}<match>$$,...$* |
| EntityMinScoreN | Matches only items with scores equal to or exceeding the |

\text { precedence. } \\
\text { on whole words, for example, part does not return from } \\
\text { partake. }\end{array}
$$ <br>

\hline you have set these parameters, NonGreedyMatch takes\end{array}\right\}\)| The maximum number of bytes that a match can have. The |
| :--- |
| default value is 256. |

## Eduction ACI Server Configuration Parameters

|  | Eduction. |
| :--- | :--- |
| RedactionOutputString | A string to include in the output in place of redacted text. If <br> neither RedactionOutputString nor <br> RedactionReplacementCharacter is set, Eduction uses the <br> default value of [redacted]. |
| RedactionReplacementCharacter | A character to include in the output in place of each character <br> in a passage of redacted text. |
| SearchFields | A comma-separated list of IDOL fields to search for entities. <br> You can search the following IDOL fields: |
| TaskN | - DREREFERENCE |
| - DRETITLE |  |
| TostProcessingTasks] | - SUMMARY <br> NumTasks <br> You can also add any customized fields present in the IDOL <br> database to this list. You must specify at least one field to |
| search, or no results return. |  |

| Eduction ACI Server Configuration Parameters |  |
| :--- | :--- |
|  | to configure. |
| [MyPostProcessingTask] | A list of the extracted entities that you want to use your post- <br> processing script to modify. <br> This parameter supports wildcard expressions. |
| Entities | Set ProcessEnMasse to True to set up an en-masse post- <br> processing task. |
| ProcessEnMasse | The path to the script to use for your pre-processing task. |
| Script |  |

## Example Configuration File

```
[License]
LicenseServerHost=127.0.0.1
LicenseServerACIPort=20000
[Server]
Port=7075
Threads=1
[Eduction]
ResourceFiles=person_name_engus.ecr
Entity0=person/femalefirstname/engus
Entity1=person/malefirstname/engus
Entity2=person/lastname/engus
//MinScore=0.5
//MaxEntityLength=12
//MatchCase=0
//CaseNormalization=Lower
//AllowOverlaps=1
//EnableComponents=1
//MatchWholeWord=0
//RedactionOutputString=[censored]
[Logging]
LogLevel=full
0=ApplicationLogStream
[ApplicationLogStream]
LogFile=application.log
```

## Include an External Configuration File

You can share configuration sections or parameters between ACI server configuration files. The following sections describe different ways to include content from an external configuration file.

You can include a configuration file in its entirety, specified configuration sections, or a single parameter.

When you include content from an external configuration file, the GetConfig and ValidateConfig actions operate on the combined configuration, after any external content is merged in.

In the procedures in the following sections, you can specify external configuration file locations by using absolute paths, relative paths, and network locations. For example:

```
../sharedconfig.cfg
K: \sharedconfig\sharedsettings.cfg
\\example.com\shared\idol.cfg
file://example.com/shared/idol.cfg
```

Relative paths are relative to the primary configuration file.

## NOTE:

You can use nested inclusions, for example, you can refer to a shared configuration file that references a third file. However, the external configuration files must not refer back to your original configuration file. These circular references result in an error, and Eduction SDK does not start.

Similarly, you cannot use any of these methods to refer to a different section in your primary configuration file.

## Include the Whole External Configuration File

This method allows you to import the whole external configuration file at a specified point in your configuration file.

## To include the whole external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the external configuration file.
3. On a new line, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (" "). You can use relative paths and network locations. For example:
```
< "K:\sharedconfig\sharedsettings.cfg"
```

4. Save and close the configuration file.

## Include Sections of an External Configuration File

This method allows you to import one or more configuration sections from an external configuration file at a specified point in your configuration file. You can include a whole configuration section in this way, but the configuration section name in the external file must exactly match what you want to use in your file. If you want to use a configuration section from the external file with a different name, see Merge a Section from an External Configuration File, on the next page.

## To include sections of an external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the external configuration file section.
3. On a new line, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (" "). You can use relative paths and network locations. After the configuration file name, add the configuration section name that you want to include. For example:
```
< "K:\sharedconfig\extrasettings.cfg" [License]
```

## NOTE:

You cannot include a section that already exists in your configuration file.
4. Save and close the configuration file.

## Include a Parameter from an External Configuration File

This method allows you to import a parameter from an external configuration file at a specified point in your configuration file. You can include a section or a single parameter in this way, but the value in the external file must exactly match what you want to use in your file.

## To include a parameter from an external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the parameter from the external configuration file.
3. On a new line, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (" "). You can use relative paths and network locations. After the configuration file name, add the name of the configuration section name that contains the parameter, followed by the parameter name. For example:
```
< "license.cfg" [License] LicenseServerHost
```

To specify a default value for the parameter, in case it does not exist in the external configuration file, specify the configuration section, parameter name, and then an equals sign (=) followed by the default value. For example:

```
< "license.cfg" [License] LicenseServerHost=localhost
```

4. Save and close the configuration file.

## Merge a Section from an External Configuration File

This method allows you to include a configuration section from an external configuration file as part of your Eduction SDK configuration file. For example, you might want to specify a standard SSL configuration section in an external file and share it between several servers. You can use this method if the configuration section that you want to import has a different name to the one you want to use.

## To merge a configuration section from an external configuration file

1. Open your configuration file in a text editor.
2. Find or create the configuration section that you want to include from an external file. For example:
[SSLOptions1]
3. After the configuration section name, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (""). You can use relative paths and network locations. For example:
[SSLOptions1] < "../sharedconfig/ssloptions.cfg"
If the configuration section name in the external configuration file does not match the name that you want to use in your configuration file, specify the section to import after the configuration file name. For example:
```
[SSLOptions1] < "../sharedconfig/ssloptions.cfg" [SharedSSLOptions]
```

In this example, Eduction SDK uses the values in the [SharedSSLOptions] section of the external configuration file as the values in the [SSLOptions1] section of the Eduction SDK configuration file.

## NOTE:

You can include additional configuration parameters in the section in your file. If these parameters also exist in the imported external configuration file, Eduction SDK uses the values in the local configuration file. For example:

```
[SSLOptions1] < "ssloptions.cfg" [SharedSSLOptions]
```

SSLCACertificatesPath=C:\IDOL\HTTPConnector\CACERTS $\backslash$
4. Save and close the configuration file.

## Lua Post-Processing

- Configure Post-Processing ................................................................................ 79
- Methods and Parameters ............................................................................... 79
- Configure En Masse Scripting ................................................................................. 80
- Example Scripts ........................................................................................... 80
- Checksum Validation .............................................................................................. 80
- Spanish Identity Card Number Validation ...................................................................... 81
- Dutch Citizen Service Number Validation
- Geographical Co-ordinate Standardization ................................................................................... 81
- Date and Time Standardization

Eduction Server, edktool, and the Eduction SDK support Lua post-processing. You can use this to carry out internal consistency checks, or to format your output. For example, if you configured an Eduction task to extract credit card numbers, you can set up a post-processing task to discard matches that do not pass checksum validation and are therefore determined to be strings of numbers rather than correctly formatted credit card numbers.

## Configure Post-Processing

To configure Lua post-processing tasks, you must specify the number of tasks and task names in the [PostProcessingTasks] section of the configuration file, for example:
[PostProcessingTasks]

```
numTasks=2
```

task0=checksum
task1=filterscore

Each task must also have its own section in the configuration file, for example:
[checksum]
type=lua
script=./scripts/checksum.lua
entities=number/creditcard
You must define a processmatch function in your script:
function processmatch (edkmatch)
where edkmatch is the object to match. This returns a Boolean value; set this to True to keep the match, or False to discard it.

## Methods and Parameters

The following methods and parameters are available:

- edkmatch:getEntityName(), edkmatch:setEntityName(new_name)
- edkmatch:getOutputText(), edkmatch:setOutputText(new_text)
- edkmatch:getMatchedText(), edkmatch:setMatchedText(new_text)
- edkmatch:getOffset(), edkmatch:setOffset(new_offset)
- edkmatch:getOffsetLength(), edkmatch:setOffsetLength(new_length)
- edkmatch:getScore(), edkmatch:setScore(new_score)
- edkmatch:getComponentCount()
- edkmatch:getComponent(index)
- edkcomponent:getName(), edkcomponent:setName(new_name)
- edkcomponent:getText(), edkcomponent:setText(new_text)
- edkmatch:addComponent(name, offset, offsetLength)

For more information, see Eduction Lua Methods Reference, on page 315.

## Configure En Masse Scripting

The previous section describes how to set up a post-processing task whereby the script performs the required action on each match individually. You can also set up en masse scripting tasks whereby all the matches found by an Eduction task are passed into a single post-processing task, which can use this information to modify all the matches at the same time. For example, you might want to increase the score of all matches that appear near other matches and are therefore considered more reliable as matches.

To configure an en masse scripting task, add the ProcessEnMasse parameter to the configuration file section for the task and set it to True.

You must define a processmatches function in your script:
function processmatches (matches)
where matches is a Lua table of all the matches extracted by your Eduction task. Each match also includes a flag to indicate if the match should display in the output.

You must set up the script so that it iterates over each match in the table, performs the post-processing task on each match, and sets setOutput to False for matches that should be discarded. You can use the sample script that is provided with Eduction as a reference.

## Example Scripts

The following example post-processing script sets the score for all matches to 0.5 :

```
function processmatch (edkmatch)
if edkmatch then
    -- just overwrite the score
    edkmatch:setScore(0.5)
    end
return true
```

You can also use the sample scripts that are included with Eduction to perform the following tasks, or you can use the sample scripts as a reference if you want to write your own scripts.

## Checksum Validation

The checksum_luhn. lua script verifies the checksum digit of each match using the Luhn algorithm, and reduces the score associated with the match if the checksum is wrong. The checksum_luhn_ enmasse. lua script performs checksum validation as an en masse processing task, discards incorrect matches, and alters the score of correct matches to equal the proportion of matches that have the correct checksum digit.

You can use these scripts with the number_cc.ecr and number_sin_ca.ecr grammar files to validate most credit card numbers.

## Spanish Identity Card Number Validation

You can use the checksum_dni_es. lua script with the number_dni_es.ecr grammar file to validate Spanish Documento Nacional de Identidad (national identity card) numbers.

## Dutch Citizen Service Number Validation

You can use the number_bsn_nl.lua script with the number_bsn_nl.ecr grammar file to validate Dutch Citizen Service Numbers (Burgerservicenummer, or BSNs).

## Geographical Co-ordinate Standardization

You can use the lat_long.lua script with the place_lat_long.ecr grammar file to convert and standardize the output of geographical co-ordinates.

## Date and Time Standardization

You can use the datetime.lua script with the datetime_advanced_eng.ecr grammar file to convert and standardize the output of dates and times in English into a standardized format in cases where there are matches on several formats. For example, you can convert both 23/11/13 and Nov 232013 to epoch seconds, or to 20131123.

The datetime_advanced_eng.ecr grammar file can understand English natural language, and relative dates such as last Saturday morning. You can provide a reference date for <today> in the Lua script to enable normalization of relative dates into standard formats.

You can also use datetime. lua to convert number matches expressed in English to numeric format

## Server Actions

You can run actions on the Eduction ACI server using the HTTP request:
http://Host:Port/?action=action[\&Parameter=VaLue[\&Parameter=VaLue...]]
For example:
http://localhost:13000/action=GetStatus
The Eduction ACI server provides the following actions (case insensitive):

| GetStatus | Returns the status of the Eduction Server, including version information and <br> entities selected for matching. |
| :--- | :--- |
| EduceFromFile | Performs Eduction on text (read from a file) and returns the matches. |
| EduceFromText | Performs Eduction on text (provided in the request) and returns the matches. |
| RedactFromFile | Performs Eduction on text (read from a file) and redacts the matches to return the <br> redacted text. |
| RedactFromText | Performs Eduction on text (provided in the request) and redacts the matches to |

return the redacted text.
For more information about these actions, and example responses, refer to the Eduction Server Reference.

## Select Entities at Runtime

You can customize the behavior of the extraction for individual query actions by specifying the configuration settings as query parameters in the ACl request. For example:
http://localhost:13000/?action=EduceFromFile\&MatchCase=True\&Grammars=place_ albal.ecr

If you specify a parameter as part of a query, it overrides the configuration file settings for the parameter.

You can specify a comma-separated list of grammar files to load as the value of the Grammars parameter. For example:

Grammars=GrammarFile[,GrammarFiLe2]
This corresponds to the ResourceFiles setting in the configuration file.
You can specify a comma-separated list of entities to use as the value of the Entities parameter. If no entities are specified in the configuration file, all public entities from the grammar files that you configured are available.

Alternatively, if your query uses several grammar files or entities, you can use wildcard expressions in the Grammars or Entities parameters. You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character. For example:

```
action=EduceFromText&Text=I thought it was a bad idea. Es ist nicht
gut.&Grammars=sentiment_*.ecr
```

This example uses all the available sentiment grammars for the extraction without you having to type a lengthy comma-separated list.

NOTE:
The grammar files and entities must already be specified in the configuration file. There must be no space before or after a comma.

You can specify the following parameters as part of your query:

| AllowMultipleResults | MatchWholeWord |
| :--- | :--- |
| AllowOverlaps | MaxEntityLength |
| CaseNormalization | MinScore |
| CJKNormalization | NonGreedyMatch |
| EnableComponents | RedactionOutputString |
| EnableUniqueMatches | RedactionReplacementCharacter |

| Locale | TangibleCharacters |
| :--- | :--- |
| MatchCase | TokenWithPunctuation |

These parameters behave in the same way as the parameters of the same name in the configuration file. See Configuration File Settings, on page 70 for more information.

A query parameter takes the value of the corresponding parameter in the configuration file as its default. If that parameter is not set in the configuration file, the query uses the default value for the parameter as described in the Eduction SDK Programming Guide. See Eduction Parameters, on page 100 for more information.

Programming Guide

## Chapter 5: edktool Command-Line Tool

This section describes edktool and the configuration files that specify Eduction settings that are used with it.

- About edktool .................................................................................................................................. 85
- edktool Syntax ....................................................................................................................... 86
- edktool Options ................................................................................................................. 87
- Command-Line Examples ............................................................................................................ 94
-Configuration Files for Eduction Settings ..................................................................................... 96
- Eduction Parameters ......................................................................................................... 100
- Match Validity ........................................................................................................................... 125

## About edktool

edktool is a tool for Eduction that allows you to compile and test your grammars. edktool can perform the following functions:

- compile grammars
- list available entities in a grammar file
- extract entities from a file based on a grammar and select entities from the grammar for extraction
- test the accuracy of the extraction process

## NOTE:

On Linux, edktool requires the C++ library, libstdc++. so. To ensure the tool can locate the required library, set the Library Path:

```
setenv LD_LIBRARY_PATH bin:$LD_LIBRARY_PATH
```

## Wildcard Expressions in edktool

The -e and -g parameters in the Generate , Compile, Assess, and Extract options in edktool support wildcard expressions. For example, if you want to use all of the available sentiment analysis files in the grammars directory, you can type -e "grammars/sentiment_*.ecr" instead of typing a lengthy comma-separated list of multiple files.

You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character.

## NOTE:

In some cases (for example, if you are running Linux), the command shell automatically expands wildcard expressions, which can produce unexpected results in Eduction. To avoid this, you should enclose your wildcard expression in quotation marks.

## edktool Syntax

## Syntax for edktool is as follows:

```
Usage: edktool {
    generate -i <inputfile> [-o <outputfile>] [-e <entityname>]
    compile [-i] <inputfile> [-e <entity>[,<entity>...]]
    [-l <licensefile>] [-o <outputfile>] [-p] |
    list <grammarfile> [-a] [-q] |
    extract [-l <licensefile>] -i <inputfile> [-c <configfile>]
            [-g <grammarfile>[,<grammarfile>...]]
            [-e <entity>[,<entity>...]] [-o <outputfile>] [-m] [-q]
            [-r <redactionfile>] [-p] |
    measure -e <expectedfile> -a <actualfile> [-o <resultsfile>] [-q] |
    assess [-l <licensefile>] [-o <resultsfile>] [-c <configfile>] [-a]
            [-m <matched entities>] [-g <grammarfile>[,<grammarfile>...]]
            [-e <entity>[,<entity>...]] [-v <valid input>]
            [-w <invalid input>] [-x] [-q] |
    permissions -d <directory> [-l <licensefile>] [-a] [-q] |
    help [<option>] }
Options:
    generate or g
        -i inputfile
        -o outputfile
        -e entityname
    compile or c
        -i inputfile
        -e entities
        -l licensefile
        -o outputfile
        -p
    list or l
            grammarfile
        -a
        -q
    extract or e
        -l licensefile
        -i inputfile
        -c configfile
        -g grammarfiles
        -e entities
        -o outputfile
        -m
        -q
        -r redactionfile
```

generate or $g$
-i inputfile
-o outputfile
-e entityname
compile or c
-i inputfile
-e entities
-l licensefile
-o outputfile
-p
list or 1
grammarfile
-a
-q
extract or e
-l licensefile
-i inputfile
-c configfile
-g grammarfiles
-e entities
-o outputfile
-m
-q
-r redactionfile

Generates an uncompiled XML (source) file
The plaintext file containing one match per line
The destination for the output XML file
The name for the single entity in the XML output Compiles a grammar file
Input grammar file
Entities to be included in the grammar The file containing the license key
Output grammar file
Treat the input file as plaintext rather than XML

Lists the available entities in a grammar file The grammar file
Show additional info - such as license requirements "Quiet Mode" suppresses all descriptive messages

Extract entities from a file
The file containing the license key
The file on which entity extraction will be performed
A configuration file controlling the extraction Grammar files to use, if "-c" is not used The entities to extract, if "-c" is not used The file containing the results of the extraction Produce match results for IDOL input files "Quiet Mode" suppresses all descriptive messages A copy of the input file, with all matches redacted

## NOTE:

If you do not specify a license key at the command line, edktool assumes that the location of the license file is licensekey. dat. If the license is kept in this location, you do not need to specify the $-/$ <licensefile> parameter.

## edktool Options

This section describes the edktool options.

- Compile ............................................................................................................................... 88
- List ................................................................................................................................................. 88
- Permissions ................................................................................................................................ 89
- Generate ................................................................................................................................... 89
- Assess .................................................................................................................................... 90
- Extract ........................................................................................................................................ 91
- Redact Extraction Results ......................................................................................................... 91
- Measure ..... 93
- Help ..... 94
- Plaintext Grammar File Format ..... 94

## Compile

This option creates a compiled Eduction grammar file.
You can use wildcard expressions in the -e parameter; see Wildcard Expressions in edktool, on page 85 for more information.
-l <Licensefile> The file containing a valid license key for Eduction.
If you do not specify a license key at the command line, edktool assumes that the location of the license file is licensekey. dat. If the license is kept in this location, you do not need to specify this parameter.
-i <inputfile> The grammar file to process. The input file can be an uncompiled (Source) XML Eduction grammar file or a plaintext grammar file.
-e <entity> A comma-separated list of entities to include in the output file. If you do not include any entities in the command line, Eduction includes all entities in the input file in the output file. If you include entities in the command line, Eduction includes only those entities specified in the output file.
-o <outputfile> The output file name. If you do not specify the output file name, Eduction creates an output file using the XML grammar file name with .ecr appended.
-p Set this parameter if you want to use a plaintext grammar file (containing one potential match on each line) rather than an XML grammar file as the input text to compile from.

When compiling, the XML file must follow the Eduction syntax rules for laying out grammar files. The ECR file is a proprietary format that is optimized for fast loading into the Eduction engine at run time. While the engine can load XML grammar files, as well as compiled ECR files, compiling a grammar file makes loading quicker.

Because compiled grammar files are binary files and cannot be read, the List option allows you to view the public entities in a compiled grammar file.

You can also specify the -p parameter at the command line to compile a grammar file in ECR format from a plaintext grammar file. The plaintext grammar file must be in the format described in Plaintext Grammar File Format, on page 94.

## List

This option lists the entities in an uncompiled (Source) XML Eduction grammar file or a compiled ECR grammar file. Listing the contents of an XML file lists all entities in the file, both private and public. Listing the contents of a compiled ECR file lists all public entities. Private entities not referenced by the public entities are removed from the compiled ECR file.

To enable this feature, type edktool l <grammarfile> at the command line.

You can also include the optional -a parameter when using the LIST option. As well as listing the components that the entity can return, this lists the licence requirements for a particular compiled grammar file. For example, the following output:

```
category: place languages: English or French
```

indicates that the user must be licensed for either English or French in the place category. If multiple lines appear, then the license must satisfy the conditions in every line.

If you include the optional -q "Quiet Mode" parameter, edktool removes all descriptive messages from the output and shows the entity list only. The output includes components if you also set the -a parameter.

## Permissions

This option reads any specified directory and returns a list of all compiled grammar files inside it that you can access using the specified licence.

To enable this feature, type edktool p-d<directory>-1 <Licencefile> at the command line. You can also include the optional parameter -a to return a list of all compiled grammar files inside the directory that are not accessible under the specified licence.

## NOTE:

If you do not specify a license key at the command line, edktool assumes that the location of the license file is licensekey. dat. If the license is kept in this location, you do not need to specify the -l <Licensefile> parameter.

You can include the optional -q parameter to enable "Quiet Mode" and remove descriptive messages from the output. If you enable "Quiet Mode", the output consists of a list of file names only, in the format Valid: filename.ecr or, if you also included the -a parameter, Invalid: filename.ecr.

## Generate

This option generates an uncompiled XML source file from a plaintext grammar file.
To enable this feature, type edktool g-i <inputfile> at the command line. You can also specify the optional -o and -e parameters.

You can use wildcard expressions in the -e parameter; see Wildcard Expressions in edktool, on page 85 for more information.

| -i <inputfile> | The plaintext grammar file to process. This file must contain one potential <br> match on each line. |
| :--- | :--- |
| -e <entity> | The resulting XML grammar file contains a single entity; you can specify the <br> name of this entity as the value of the -e parameter. If you do not specify a |
| name, the entity will be given a default name based on the name of the input <br> file. |  |
| - - <outputfile> | The output file name. |

## Related Topics

- Plaintext Grammar File Format , on page 94

## Assess

This option enables you to assess the performance and accuracy of an Eduction grammar against a set of pre-tagged examples.

You must supply a text file with one phrase on each line; the Assess feature checks whether each line contains a match.

You must specify at least one input file, using the -v parameter or the -w parameter. If required, you can specify both of these parameters.

You can use wildcard expressions in the -e and -g parameters; see Wildcard Expressions in edktool, on page 85 for more information.
-l <Licensefile> The file containing a valid license key for Eduction.
If you do not specify a license key at the command line, edktool assumes that the location of the license file is licensekey. dat. If the license is kept in this location, you do not need to specify this parameter.
-c <configfile> A configuration file controlling the assessment. The configuration file can be either an IDOL Server style .CFG configuration file or an XML configuration file. See Configuration Files for Eduction Settings, on page 96.

You can specify one or more grammar files and one or more entities in place of a configuration file. Specifying a configuration file overrides the grammar or entity parameters.
-g <grammarfile> A grammar file to use when -c is not used.
If you provide a grammar file but you do not specify any entities with -e, Eduction extracts all entities in the grammar file.
-e <entity> The entities to extract when -c is not used. Separate multiple entities with a comma.
(Optional) Modifies the behavior so that the Assess feature checks for exact matches.
-m <matched (Optional) This parameter does not change the extraction behavior, but entities> enables you to check which entities are producing the matches.

A file of phrases where a match would be valid.
A file of phrases where a match would be invalid.
(Optional) The output includes explanations of each failure, and statistics such as recall, precision, and F1 (depending on the type of input file you provided). Include the - a parameter to display additional output, including the results for every phrase in your input files.
-o <outputfile> (Optional) By default, Eduction sends output to the console. To send the
output to a file, use the -o parameter.
The output is a list of all phrases that failed. For valid input this would be a phrase that contained no match; for invalid input this would be a phrase that contained a match.
-q (Optional) Sets "Quiet Mode" so that descriptive messages are removed, and the output consists only of a list of examples that failed, in the form "FAIL: "text" is matched by "entity" or similar, depending on the test specifications. If you also set the -a parameter, examples that pass are also included in the output.

For more information on how to use the Assess feature to check the effectiveness and performance of your grammar files, refer to IDOL Expert.

## Extract

This option extracts entities from a document. It can print the output to a file, or to the console. You can use this option to test your grammars.

You can use wildcard expressions in the -e and -g parameters; see Wildcard Expressions in edktool, on page 85 for more information.

## Redact Extraction Results

You can enable redaction on extracted matches in edktool either by setting RedactedOutput to True in the edktool configuration file, or by specifying a redaction file using the $-r$ parameter at the command line. Note that edktool only performs redaction on fields that you have configured as IDOL search fields.

If you have specified an IDX file to perform extraction on, existing fields are preserved in their unredacted form, and a redacted copy of each search field is added to the IDX file, with _REDACTED appended to the original field name. For example:
\#DREREFERENCE 1
\#DREFIELD DRECONTENT_REDACTED="The driver \#\#\#\#\#\#\#\#\#\# was questioned." \#DRECONTENT
The driver Joe Bloggs was questioned.
\#DREENDDOC
If you have specified a plaintext file to perform extraction on, the entities identified as matches by edktool are redacted from the input text to form the redacted output. For example:

Input:
The driver Joe Bloggs was questioned.
Output:
The driver \#\#\#\#\#\#\#\#\#\# was questioned.
Eduction sends redacted output to the file specified in the-r parameter. If you do not specify this argument but you have enabled redaction in the configuration file, Eduction displays redacted output in
the console after the list of matches, unless you have specified the -q parameter at the command line to enable Quiet mode. In Quiet mode, redacted output does not display in the console.

| -l <Licensefile> | The file containing a valid license key for Eduction. <br> If you do not specify a license key at the command line, edktool assumes <br> that the location of the license file is licensekey. dat. If the license is kept <br> in this location, you do not need to specify this parameter. |
| :--- | :--- |
| -i <inputfile> | The file to perform entity extraction on. The input file can be either an IDOL <br> IDX file, an IDOL XML file, or a plain text file. It must be UTF-8 encoded. |

## NOTE:

If the input file is an XML file, the configuration file (in either IDOL configuration file format or XML format) must contain entries for the DocumentDelimiterCSVs parameter. If this setting is not correct, Eduction might not find any documents in the XML file. For information on how to set this option, refer to the Eduction Parameters, on page 100.
-c <configfile>
-g <grammarfile> A grammar file to use when - c is not used.
If you provide a grammar file but do not specify any entities with -e, Eduction extracts all entities in the grammar file.

The entities to extract when -c is not used. Separate multiple entities with a comma.
-o <outputfile> The file containing the results of the extraction. The content of the optional output file depends on the type of input file provided and whether the -m option is used.
If the input file type is an IDOL file and the -m option is not used, the output file is identical to the input file, except the matched entities are appended to each document as additional fields. This behavior is the same as Eduction running in IDOL.
If the input file is a plain text file or an IDOL file with the -m option, the output file is an XML file containing the matched entities.
If the input file is an IDOL file, the output file also contains document information.

Produce match results for IDOL input files.
(Optional) Sets "Quiet Mode" so that descriptive messages and redacted output are removed, and the output consists of the XML matchlist only (that
is, an XML document with all the matches and any configured metadata).

```
-r<redaction_ A copy of the input file, with all matches redacted.For example, if you
file> specified an IDX input file, the content is sent to the redaction file as follows,
with the redactions made in place:
#DREREFERENCE 1
#DRECONTENT
The driver ########## was questioned.
#DREENDDOC
Set this parameter if you want to use a plaintext grammar file rather than an XML grammar file as the input text to extract from.
```

The extract option requires an input file (either in IDOL IDX, IDOL XML, or plain text format) and either a configuration file or a grammar file. If you do not provide a configuration file, edktool searches the file for any specified entities in the specified grammar (or all entities, if none are specified). For example, in the simplest command line:

```
C:\>edktool e -i myData.txt -g grammar1.ecr,grammar2.ecr
```

edktool is invoked with no configuration file. It uses the command-line arguments to process the data file myData.txt with the grammar files grammar1.ecr and grammar2.ecr. Eduction identifies all the entities in the two grammar files, and matches on these. The output is sent to the console in XML format, identifying matches in the data file and using the entity names to generate field names for the matches that contain the matched data. Assuming myData. txt is a plain text file, the entire body of the file is matched.

You can also specify the -p parameter at the command line to extract matches from a plaintext grammar file.

The plaintext grammar file must be in the format described in Plaintext Grammar File Format, on the next page.

## Measure

This option measures precision and recall between extraction runs by comparing the expected results of entity extraction with the actual results.

Expected results are created once and remain as a base reference for ongoing tests. Actual results are generated as required each time a grammar is modified. The two results are compared to generate precision and recall information.

To generate expected results, run edktool -extract, and then revise the generated output file so that it contains the correct matches. From then on, edktool -extract is used only to create the actual results, and the two files are compared against each other to generate precision and recall information on an ongoing basis.
-e <expectedfile> The expected results file from edktool -extract.
-a <actualfile> The actual results file from subsequent extraction runs with modified grammar files.
-o <resultsfile> The results, including precision, recall, and differences.
(Optional) Sets "Quiet Mode" so that descriptive messages are removed, and the output consists of only an XML document containing the differences between the expected and actual output.

For more information on how to use the Measure feature to check the effectiveness and performance of your grammar files, refer to IDOL Expert.

## Help

This option lists the valid edktool options along with brief descriptions for each.

## Plaintext Grammar File Format

Plaintext grammar files must have only a single entity, that consists entirely of headwords. Patterns, synonyms, scoring and so on are not supported.

Each line in the grammar file must consist of either a headword, a blank line, or a comment (a line beginning with // that is skipped when the file is read). Whitespace and blank lines are ignored when the file is read.

## Command-Line Examples

This section provides some examples of the command-line tool functionality.
-Compile Grammars .............................................................................................................. 94

- List Entities ................................................................................................................................ 94

- Measure Accuracy ................................................................................................................... 95
- Run Assessments ........................................................................................................ 95

## Compile Grammars

edktool c mygrammar.xml
Compiles mygrammar.xml into mygrammar.ecr.

```
edktool c -i mygrammar.xml -e common/* -o compiledgrammar.ecr
```

Compiles all the entities in the common entity type in mygrammar.xml into compiledgrammar.ecr.

## List Entities

```
edktool list mygrammar.ecr
```

Lists all public entities in the compiled grammar file, mygrammar.ecr.

## Extract Entities

edktool e -i myPlainTextFile.txt -g myGrammar.ecr
Extracts all entities in myGrammar. ecr from myPlainTextFile.txt, sending the output to the console in XML format, with the field names for the matching text automatically generated from the entity names found in myGrammar.ecr.

```
edktool e -i myIDOLfile.idx -c myIDOLConfigFile.cfg -o myoutputfile.idx
```

Using the configuration file myIDOLConfigFile.cfg, extract entities from the file myIDOLfile.idx and direct the output with additional Eduction fields to the file myoutputfile.idx.

```
edktool e -i myIDOLfile.idx -c myIDOLConfigFile.cfg -o myoutputfile.xml -m
```

The same as the previous example, except output the match results to an edktool XML file.

## Measure Accuracy

```
edktool m -e expected.xml -a actual.xml -o difference.xml -q
```

Compare expected.xml with actual.xml and put the difference in difference.xml, including precision and recall. "Quiet Mode" is enabled, so all descriptive messages are removed from the output.

## Run Assessments

```
edktool a -l <license> -c <configuration_file> [-a] [-o <output_file>]
```

Run several assessments from a single Eduction configuration file.
The configuration file must contain a numbered [assessment $N$ ] section for each assessment you want to run. You must specify the input files, the entities to match, and whether matching should be exact. For example:

```
[assessment0]
valid=data.txt
[assessment1]
entities=entity1,entity2
valid=match.txt
invalid=should_not_match.txt
exact=true
```

You can specify multiple entities either by separating them with commas, or by using wildcard expressions. You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character. For example, set Entities to org/soccer/* to use the entities org/soccer/us, org/soccer/gb, org/soccer/de, and so on without having to type a lengthy comma-separated list.

## Configuration Files for Eduction Settings

The Extraction option of edktool can take its configuration settings from one for the following file types:

- .CFG file
- XML file

You can use the same Eduction configuration settings in each file format, including wildcard expressions where applicable.

## Define Eduction Settings in the .CFG Configuration File

The Eduction configuration settings that can be defined in the IDOL Server format .CFG configuration file are described in Eduction Parameters, on page 100.

The .CFG configuration file consists of several sections that are identified by a phrase in square brackets. Each section contains parameters (name/value pairs). For example:

```
[Eduction]
ResourceFiles=C:\MyGrammar\gram1.ecr
```

## To define Eduction settings in the .CFG configuration file

1. Open the .CFG configuration file in a text editor.
2. Set the Eduction SDK parameters as required. The following parameters are available (see Configuration File Settings, on page 70 and Eduction Parameters, on page 100 for more information):

| AllowDuplicates | Locale |
| :--- | :--- |
| AllowMultipleResults | MatchCase |
| AllowOverlaps | MatchWholeWord |
| CaseNormalization | MaxEntityLength |
| CJKNormalization | MaxMatchesPerDoc |
| CaseSensitiveFieldName | NonGreedyMatch <br> OutputScores <br> (used by edktool) <br> Databases |
| EnableCompimpleMatchlnfo <br> (used by edktool only) | RedactedOutput |
| EnableUniqueMatches | RedactionOutputString |
| EntityN |  |

| EntityAdvancedFieldN | RedactionReplacementCharacter |
| :--- | :--- |
| EntityComponentFieldN | ResourceFiles |
| EntityFieldN | SearchFields |
| EntityMatchRangeN | SuppressMatchLogging |
| EntityMinScoreN | TangibleCharacters |
| EntitySearchFieldsN | TokenWithPunctuation |
| EntityZoneN | ZoneEndN |
| LanguageDirectory | ZoneStartN |

## NOTE:

If you set CaseNormalization to Lower or Upper, set MatchCase to True.
3. Set the following parameters in the [Server] section of the configuration file. These settings are critical for the correct reading of documents.

CantHaveFieldCSVs
DocumentDelimiterCSVs
4. Save and close the configuration file.

## Modify Configuration Parameter Values

The following section describes how to enter parameter values in the configuration file.

## Enter Boolean Values

The following settings for Boolean parameters are interchangeable:
TRUE = true $=$ True $=\mathrm{ON}=\mathrm{on}=\mathrm{Y}=\mathrm{y}=1$
FALSE $=$ false $=$ False $=$ OFF $=$ off $=N=n=0$

## Enter String Values

Some parameters require string values that contain quotation marks. Percent-encode each quotation mark by inserting a backslash before it.

For example:
FIELDSTART0="<font face=\"arial\"size=\"+1\"><b>"
Here, the beginning and end of the string are indicated by quotation marks, while all quotation marks that are contained in the string are percent-encoded.
If you want to enter a comma-separated list of strings for a parameter, and one of the strings contains a comma, you must indicate the start and the end of this string with quotation marks.
For example:
ParameterName=cat, dog, bird, "wing, beak", turtle

If any string in a comma-separated list contains quotation marks, you must put this string into quotation marks and percent-encode each quotation mark in the string by inserting a backslash before it.

For example:
ParameterName="<font face=\"arial\"size=\"+1\"><b>", dog, bird, "wing, beak", turtle

## Sample Configuration File

The following shows the configuration for a sample Eduction task:

```
[Eduction]
ResourceFiles=C:\MyGrammar\gram1.ecr, C:\MyGrammar\gram2.ecr
ZoneStart0=<TEXT>
ZoneEnd0=</TEXT>
ZoneStart1=acknowledgements
ZoneEnd1=introduction
Entity0=common/aus_holidays
EntityField0=HOLIDAYS
EntityZone0=0
Entity1=common/us_holidays
EntityField1=HOLIDAYS
EntityZone1=0
Entity2=us/social_security_number
EntityField2=SS_NUMBER
EntityZone2=1
SearchFields=DRECONTENT
AllowDuplicates=HOLIDAYS
[Logging]
LogLevel=Full
```

This sample uses two grammar files. It searches for all Australian and U.S. holidays in the DRECONTENT field between the text <Text> and </Text>, adding the matches as additional fields HOLIDAYS. It also searches for a single social security number in DRECONTENT between the text acknowledgements and introduction and adds the results as a new field SS_NUMBER.

## Define Eduction Settings in the XML Configuration File

The Eduction configuration elements that you can define in the XML file are described in Eduction Parameters, on page 100.

The following XML configuration file example shows all the available XML elements:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- Sample Eduction XML configuration file for the edktool utility -->
<Eduction>
    <!-- Global Settings (Defaults shown) -->
    <MatchWholeWord>true</MatchWholeWord>
    <SuppressMatchLogging>false</SuppressMatchLogging>
```

```
    <MaxEntityLength>256</MaxEntityLength>
    <AllowOverlaps>false</AllowOverlaps>
    <EnableComponents>false</EnableComponents>
    <OutputSimpleMatchInfo>true</OutputSimpleMatchInfo>
    <MatchCase>true</MatchCase>
    <DocumentDelimiterCSVs>*/DOCUMENT</DocumentDelimiterCSVs>
    <CantHaveFields>
    <CantHaveField>*/DRESTORECONTENT</CantHaveField>
    <CantHaveField>*/CHECKSUM</CantHaveField>
    <CantHaveField>*/DREWORDCOUNT</CantHaveField>
    <CantHaveField>*/DRETYPE</CantHaveField>
    <CantHaveField>*/IMPORTBODYLEN</CantHaveField>
    <CantHaveField>*/IMPORTMETALEN</CantHaveField>
    <CantHaveField>*/IMPORTLINKLEN</CantHaveField>
    <CantHaveField>*/IMPORTTITLELEN</CantHaveField>
    <CantHaveField>*/IMPORTQUALITY</CantHaveField>
    <CantHaveField>*/DREPAGE</CantHaveField>
    <CantHaveField>*/DREFILENAME</CantHaveField>
    <CantHaveField>*/dredoctype</CantHaveField>
    </CantHaveFields>
    <!-- Eduction grammar (resource) files to load -->
    <ResourceFiles>
    <ResourceFile>phone.ecr</ResourceFile>
    <ResourceFile>jargon.ecr</ResourceFile>
</ResourceFiles>
    <!-- IDOL databases to search. Applies only to IDOL IDX or IDOL XML input
documents -->
    <Databases>
        <Database>Contact</Database>
        <Database>Customer</Database>
    </Databases>
    <!-- Document fields to search. ignored for plain text input documents
(DRECONTENT is the default) -->
    <SearchFields>
    <SearchField>DREREFERENCE</SearchField>
    <SearchField>DRETITLE</SearchField>
    <SearchField>DRECONTENT</SearchField>
</SearchFields>
<!-- Definitions of search zones within a document -->
<Zones>
    <Zone>
        <Name>Summary</Name>
        <StartPattern>Executive Summary</StartPattern>
        <EndPattern>Introduction</EndPattern>
        </Zone>
```

```
        <Zone>
            <Name>Body</Name>
            <StartPattern>Introduction</StartPattern>
        </Zone>
    </Zones>
    <!-- Fields generated from a match. Always required, but applies only to IDOL
IDX or IDOL XML input documents where the output is also a modified IDOL document
->
    <TargetFields>
        <TargetField>
            <Name>PHONE</Name>
            <AllowDuplicates>false</AllowDuplicates>
            </TargetField>
    </TargetFields>
    <!-- Eduction grammar entities used for searching -->
    <Entities>
        <Entity>
            <Name>phone/all</Name>
            <TargetField>PHONE</TargetField>
            <MatchRange>1,2-4</MatchRange>
            <MinScore>0.5</MinScore>
            <Zone>Summary</Zone>
            <Zone>Body</Zone>
        </Entity>
    </Entities>
</Eduction>
```

If Eduction reads an IDOL XML data file, you must configure DocumentDelimiterCSVs, and also at least one entry for the CantHaveFields setting. If this is not present, Eduction defaults to DOCUMENT and EDUCTION_DUMMY_FIELD respectively.

## Eduction Parameters

The following parameters can be used in the .CFG configuration file or the XML configuration file.

- CantHaveFieldCSVs ............................................................................................. 102
- DocumentDelimiterCSVs .............................................................................................. 102
- AllowDuplicates .................................................................................................... 103
- AllowMultipleResults .............................................................................................. 103
- Example ........................................................................................................ 103
- AllowOverlaps ..................................................................................................................... 104
- CaseNormalization .................................................................................................. 105
- CaseSensitiveFieldName ....................................................................................... 105
- CJKNormalization ..... 106
- Databases ..... 106
- EnableUniqueMatches ..... 107
- Entities ..... 107
- EntityAdvancedFieldN ..... 108
- EntityComponentFieldN ..... 109
- EntityFieldN ..... 110
- EntityN ..... 111
- EntityMatchRangeN ..... 112
- EntityMinScoreN ..... 112
- EntitySearchFieldsN ..... 113
- EntityZoneN ..... 114
- LanguageDirectory ..... 115
- Locale ..... 115
- MatchCase ..... 115
- MatchTimeout ..... 116
- MatchWholeWord ..... 116
- MaxEntityLength ..... 117
- MaxMatchesPerDoc ..... 117
- NonGreedyMatch ..... 118
- OutputScores ..... 118
- ProcessEnMasse ..... 119
- RedactedOutput ..... 119
- RedactionOutputString ..... 120
- RedactionReplacementCharacter ..... 120
- ResourceFiles ..... 120
- Script ..... 121
- SearchFields ..... 121
- SuppressMatchLogging ..... 122
- TangibleCharacters ..... 122
- TokenWithPunctuation ..... 123
- ZoneEndN ..... 123
- ZoneStartN ..... 124
- Configuration Parameters Used by edktool Only ..... 124
- EnableComponents ..... 125
- OutputSimpleMatchInfo ..... 125

## CantHaveFieldCSVs

Names of fields Eduction ignores when reading an XML file. Allows you to specify the fields in documents that are discarded before the documents are stored.

To specify multiple fields, separate them with commas (there must be no space before or after a comma). You can use wildcards.

| Type: | String |
| :--- | :--- |
| Default: | No |
| Required: | Server |
| Configuration <br> Section: | CantHaveFieldCSVs=*/STANDARD_HEADER |
| Example: | In this example, any STANDARD_HEADER fields that a document contains are <br> discarded before the document is stored in IDOL server. |
| See Also: |  |

## DocumentDelimiterCSVs

File fields (tags) marking start and end of document. Allows you to specify the fields in a file that indicate the beginning and end of a document, so that the documents are indexed individually. You must have only one document level for each XML schema.
If documents are indexed into IDOL server using a DREADD or DREADDDATA index action, and the index action uses a DocumentDelimiters parameter that conflicts with the DocumentDelimiterCSVs setting in the IDOL server configuration file, the index action parameter overrides the configuration parameter.

| Type: | String |
| :--- | :--- |
| Default: | No |
| Required: | Server |
| Configuration <br> Section: | DocumentDelimiterCSVs $=* /$ DOCUMENT, $/$ /SPEECH <br> In this example, the beginning and end of individual documents in a file is <br> marked by opening and closing DOCUMENT and SPEECH tags (or fields if you <br> are running IDOL server in DRE3 mode). |
| Example: |  |
| See Also: |  |

## AllowDuplicates

A list of document fields in which Eduction can write multiple results from a single entity. If you allow multiple results from a single entity by setting AllowMultipleResults, below to TRUE, and the input text contains more than one match to an entity, Eduction writes the results to multiple fields with the same name.

This parameter is used only when generating output in IDOL IDX format. It has no effect on XML.
You can specify multiple fields by separating them with commas.

| Type: | String |
| :--- | :--- |
| Default: | No |
| Required: | Any section that you have defined for Eduction settings. |
| Configuration <br> Section: | AllowDuplicates=ANIONIC_SURFACTANTS, PERSON |
| Example: | AllowMultipleResults, below <br> EntityN, on page 111 <br> EntityFieldN, on page 110 |
| See Also: |  |

## AllowMultipleResults

This parameter determines how many results to return in cases where multiple matches begin at the same offset in the input text. By default, only one result can be returned, but you can use the AllowMultipleResults parameter if you want to return other matches (either from the same entity or from other entities).
Set AllowMultipleResults to one of the following options:

- All or True. This option returns all results at a specified offset.
- No or False. Only one result at a specified offset is returned.
- OnePerEntity. Up to one result at a specified offset per entity can be returned.

## NOTE:

If you are writing the results of Eduction to document fields in IDX format, and you have allowed multiple results for a single entity by setting this parameter to All or True, you should include the relevant fields in the parameter AllowDuplicates, above.

## Example

With the following entities, Georgia might return Georgia (name), Georgia (US state) or Georgia (country). By default, Eduction returns only one match. This is appropriate if it is not important to you that Georgia has multiple interpretations. Set the AllowMultipleResults configuration parameter to

All to return all three matches. Set the AllowMultipleResults configuration parameter to OnePerEntity to return one match from each entity. This is appropriate if it is important to you that Georgia is a place and a name, but not that it refers to multiple places.

```
<entity name="names">
    <entry headword="Georgia (name)">
        <synonym>Georgia</synonym>
    </entry>
    <entry headword="Henry (name)">
        <synonym>Henry</synonym>
    </entry>
</entity>
<entity name="places">
    <entry headword="Delaware (US state)">
        <synonym>Delaware</synonym>
    </entry>
    <entry headword="Georgia (US state)">
        <synonym>Georgia</synonym>
    </entry>
    <entry headword="Georgia (country)">
        <synonym>Georgia</synonym>
    </entry>
    <entry headword="Mongolia (country)">
        <synonym>Mongolia</synonym>
    </entry>
</entity>
```

| Type: | String |
| :--- | :--- |
| Default: | No |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings |
| Example: | AllowMultipleResults=All |
| See Also: | AllowDuplicates, on the previous page <br> EntityN, on page 111 <br> EntityFieldN, on page 110 <br> NonGreedyMatch, on page 118 |

## AllowOverlaps

A Boolean that specifies whether Eduction returns more than one entity from any one section of text. To return only one entity from a section of text, set this parameter to False. To return all entities in the text, set this parameter to True.

For more information on overlapping and duplicate matches, refer to IDOL Expert.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | AllowOverlaps=True |
| See Also: | NonGreedyMatch, on page 118 |

## CaseNormalization

The case conversion to use for all incoming text. To improve performance, use this parameter to convert all text to lowercase or uppercase before attempting to match text.

This parameter takes one of the following values:

- None. No case conversion.
- Lower. All incoming text is converted to lowercase.
- Upper. All incoming text is converted to uppercase.

If your grammar file consists of only lowercase or only uppercase characters but your text is mixed case, you can improve performance by setting CaseNormalization to Lower or Upper respectively. This provides a greater performance improvement than setting MatchCase to False.

If you set this parameter to Lower or Upper, set MatchCase to True.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | CaseNormalization=lower |
| See Also: | CaseSensitiveFieldName, below <br> MatchCase, on page 115 |

## CaseSensitiveFieldName

A Boolean that specifies whether to preserve the case of configured field names. By default, the Eduction module converts all field names to uppercase when it produces matches. To preserve the case of the field names, set this parameter to True. This option makes field names case sensitive.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | CaseSensitiveFieldName=True |
| See Also: |  |

## CJKNormalization

This parameter allows you to specify how to normalize Chinese, Japanese, and Korean data before extraction, in all Eduction components.

You can specify the value of CJKNormalization as follows:

- Kana. Half width kana to full width kana.
- OldNew. Old kanji to new kanji.
- Number. Chinese or kanji number characters to ASCII number characters.
- HWNum. Full width number characters to ASCII number characters.
- HWAlpha. Full width alphabet characters to ASCII alphabet characters.
- SimpChi. Traditional Chinese to simplified Chinese.
- FWJamo. Half width jamo to full width jamo.

Separate multiple options with a comma.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | CJKNormalization=SimpChi, Kana |
| See Also: |  |

## Databases

The names of the databases to which a document belongs. Eduction runs only on documents that belong to the comma-separated list of databases. If you do not list databases, Eduction is run on documents from all databases.

## NOTE:

If an IDX does not have a DREDBNAME entry for a document, matching is not done on that document. However, if all databases are selected, matching is done.

| Type: | String |
| :--- | :--- |
| Default: | No |
| Required: | Any section that you have defined for Eduction settings. |
| Configuration <br> Section: | Databases=DB1, DB2, DB3 |
| Example: | EntityN, on page 111 <br> EntityFieldN, on page 110 |
| See Also: |  |

## EnableUniqueMatches

A Boolean that specifies whether to return only unique matches in each document. To return a single occurrence of a particular value, set this parameter to True. When EnableUniqueMatches=True, two EntityN definitions cannot return the same value, even if they use different patterns. If the same value occurs more than once, only the first instance is returned, even if the matches occur for different entities.

Duplicates display by default unless you set EnableUniqueMatches to True to explicitly remove them.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | EnableUniqueMatches=True |
| See Also: |  |

## Entities

A list of entities that you want to modify using the post processing script. If you do not set this parameter, you can use the script to modify the matches for every entity.

You can separate multiple entities with a comma, or, you can use wildcard expressions. You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character. For example, set Entities to phone/* to apply the script to the phone/landline/gb, phone/mobile/gb entities and so on.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for an Eduction post processing task. |
| Example: | Task0=EductionLuaPostProcessing <br> [EductionLuaPostProcessing] <br> Script=scripts/eduction_post_process.lua <br> Entities=phone/landline/gb, phone/mobile/gb |
| See Also: | Script, on page 121 <br> ProcessEnMasse, on page 119 |

## EntityAdvancedFieldN

A comma-separated list of advanced fields to return.
To use this option you must:

- set OutputSimpleMatch to False for edktool.
- set EnableComponents to True for edktool.
- define components in the entity definition.

You configure EntityAdvancedFieldN in the same way as EntityFieldN. Specify a comma-separated list of advanced fields that you want to return. The value of the advanced field is the output of simple operations (min, max, sum, and ave) on the values of entity components.

For example, for the following configuration:

```
Entity0=testgrammar/testentity
EntityField0=FIELD0
EntityAdvancedField0=OfferPrice:max(price1 price2),BidPrice:min(price1 price2)
```

And the following data:

```
share price1 price2
Com1 165 167
Com2 1890 1880
```

An entity with the following pattern:

```
<grammar name="testgrammar">
<entity name="testentity" type="public">
<pattern>(?A=price1:\d+)\s+(?A=price2:\d+)</pattern>
</entity>
</grammar>
```

Returns the following results as fields:

```
#DREFIELD FIELD0="165 167"
#DREFIELD OfferPrice="167"
#DREFIELD BidPrice="165"
#DREFIELD FIELD0="1890 1880"
#DREFIELD OfferPrice="1890"
#DREFIELD BidPrice="1880"
\begin{tabular}{|l|l|}
\hline Type: & String \\
\hline Default: & None \\
\hline Required: & No \\
\hline Configuration & \begin{tabular}{l} 
Entity \(0=\) testgrammar/testentity \\
EntityField0=FIELD0 \\
EntityAdvancedField0=OfferPrice:max(price1 \\
price2),BidPrice:min(price1 price2)
\end{tabular} \\
\hline Example: & AllowOverlaps=True \\
\hline See Also: & \begin{tabular}{l} 
EntityN, on page 111 \\
EntityZoneN, on page 114
\end{tabular} \\
\hline
\end{tabular}
```

## EntityComponentFieldN

A comma-separated list of entity components that you want to return as fields.
To use this option you must:

- set OutputSimpleMatch to False for edktool.
- set EnableComponents to True for edktool.
- define components in the entity definition.

You configure EntityComponentFieldN in the same way as EntityFieldN. Specify a comma-separated list of entity components that you want to return as fields.

For example, for the following configuration:

```
Entity0=testgrammar/testentity
EntityField0=FIELD0
EntityComponentField0=Name,Age
```

And the following data:

| name | age |
| :--- | :--- |
| geoff | 45 |
| jane | 54 |

An entity with the following pattern:

```
<grammar name="testgrammar">
<entity name="testentity" type="public">
<pattern>name\s+age(\n(?A=Name:\w+)\s+(?A=Age:\d+)){1,}</pattern>
```

```
</entity>
</grammar>
```

Returns the following values as fields:
\#DREFIELD Name="geoff"
\#DREFIELD Age="45"
\#DREFIELD Name="jane"
\#DREF

\#DREFIELD Age="54" | Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Entity0=testgrammar/testentity <br> EntityField0=FIELD0 <br> EntityComponentField0=Name, Age |
| See Also: | EntityN, on the next page <br> EntityZoneN, on page 114 |

## EntityFieldN

A comma-separated list of document fields to associate with the entities specified by the EntityN parameter. If entities are identified in a document, the text is saved in the fields specified by this parameter. The entity field number $N$ must match the corresponding EntityN number.

A many-to-many relationship exists between the EntityN and EntityFieldN parameters. If an EntityN setting does not have an EntityFieldN setting, text matching the entity is not passed to Eduction.

If no EntityN settings are provided, EntityFieldN settings are ignored, because Eduction automatically generates EntityFieldN settings corresponding to each EntityN, on the next page setting that exists in the selected grammars.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Entity $\theta=$ edk_common_entities/ss_number <br> EntityField $0=$ SOCIAL_SECURITY_NUMBER |

|  | Entity1=edk_common_entities/postal_address <br> EntityField1=SHIPPING_ADDRESS |
| :--- | :--- |
| See Also: | EntityN, below |
|  | EntitySearchFieldsN, on page 113 |
|  | EntityZoneN, on page 114 |

## EntityN

A comma-separated list of entities to extract. Entities are defined in the resource file identified in the ResourceFiles parameter. Replace $N$ with the zero-based rank of the entity.

You must associate each entity with a field by using the EntityFieldN parameter.
You cannot use the entity name entities/ZoneStartN or entities/ZoneEndN (where $N$ is a numeric value). These entity names are reserved for use by Eduction.

If you do not define an EntityN parameter, Eduction looks for all entities in all loaded grammar files. In this case, the EntityFieldN settings are automatically generated from the entities found in grammar files by converting the entity names to uppercase and replacing slashes with an underscore. For example, if the entity edk_common_entities/place is found, Eduction generates the entity field: EDK_ COMMON_ENTITIES_PLACE.

If you want to use several entities, you can use wildcard expressions instead of typing a lengthy comma-separated list. For example:

```
Entity0=place/city1/*,place/city2/*
EntityField0=CITY
Entity1=place/*/spabo
EntityField1=BOLIVIAN_PLACE
```

You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Entity $0=$ =edk_common_entities/ss_number <br> EntityFieldd=SOCIAL_SECURITY_NUMBER <br> EntityZone0=0 |
| Entity1=edk_common_entities/postal_address <br> EntityField1=SHIPPING_ADDRESS <br> EntityZone1=1 |  |
| ZoneStart0=Social Security: |  |

|  | ZoneEnd0=Shipping Address |
| :--- | :--- |
| ZoneStart1=Shipping Address: |  |
| ZoneEnd1=Billing Address |  |$|$| See Also: | EntityFieldN, on page 110 <br> Entity <br>  <br>  <br>  <br> EntityScoreN, below <br> EntoneN, on page 114 |
| :--- | :--- |

## EntityMatchRangeN

A range of matching instances of the entity that are returned. The entity match range number $N$ must match the corresponding Entity N number. The format of the range is as follows:

| <match>$\{-\\|,\}<match>$\[, $\ldots \backslash]^{*}$ |  |
| :--- | :--- |
| Type: | String |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Entity $0=e d k-c o m m o n \_e n t i t i e s / s s ~ n u m b e r ~$ <br> EntityMatchRange= $=1-3,6,9-$ <br> This example specifies the first through third match for the ss_number <br> entity, as well as the sixth match and all matches starting with the ninth. |
| See Also: | EntityN, on the previous page |

## EntityMinScoreN

Matches only items with scores equal to or exceeding the threshold. The entity minimum score number $N$ must match the corresponding Entity $N$ number. The lowest possible score is 0 . The upper limit varies depending on the entity.

The score for an entity is defined by the author of the grammar and defaults to 1 . See the Eduction Grammar Syntax for a description of the score attribute.

The minimum score defaults to 0 , which returns all matches.
As the minimum score is increased above 0 , up to a maximum of 1 , the user of the grammar is indicating that matches must meet a higher confidence level for the match to be returned. If scoring is not used by the author of an entity, the minimum score parameter specified by the user has no effect, because by default the entity has a score of 1 and therefore will always be returned.

The entity number $(N)$ in EntityMinScore $N$ must match the corresponding entity number in the Entity $N$ entry. For example:

Entity0=person/namefirstlast/engus
EntityMinScore0=0.5

| Type: | Long |
| :--- | :--- |
| Default: | 0 |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Entity $0=$ edk_common_entities/ss_number <br> EntityMinScore0=3 |
| See Also: | EntityN, on page 111 |

## EntitySearchFieldsN

The EntitySearchFields $N$ parameter specifies the document fields to search for the corresponding EntityN entity.

Use this parameter if you want to search a different set of fields than is specified by SearchFields, on page 121. If you do not set EntitySearchFieldsN, Eduction searches the fields specified by the SearchFields parameter.

| Type: | String |
| :--- | :--- |
| Default: | The value of SearchFields, on page 121 |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings <br> Example: <br> In the following example, matches for Entity0 (airport/icao) are <br> returned only if they occur in the STARTAIRPORT or DESTAIRPORT fields. <br> The EntityFieldsN parameter is not set for Entity4 <br> (place/state/engus), so matches are returned if they are present in the <br> fields specified by the SearchFields parameter. <br> [Eduction] <br> SearchFields=DRECONTENT |
|  | Entity0=airport/icao <br> EntityField0=AIRPORTCODE <br> EntitySearchFields0=STARTAIRPORT, DESTAIRPORT |
| Entity1=person/femalefirstname/engus |  |

|  | EntityField1=FIRSTNAME |
| :--- | :--- |
| EntitySearchFields1=PASSENGER_FIRSTNAME |  |
| Entity2=person/malefirstname/engus |  |
| EntityField2=FIRSTNAME |  |
| EntitySearchFields2=PASSENGER_FIRSTNAME |  |
|  | Entity3=person/lastname/engus |
| EntityField3=SURNAME |  |
| EntitySearchFields3=PASSENGER_SURNAME |  |
|  | Entity4=place/state/engus <br> EntityField4=STATE |
| See Also: | EntityN, on page 111 |
|  | EntityFieldN, on page 110 |
| SearchFields, on page 121 |  |

## EntityZoneN

Associates an EntityN entity with one or more zones defined using the ZoneStartN and ZoneEndN parameters. Type the number of the ZoneStart $N$ and ZoneEnd $N$ parameters to associate with the EntityN. Eduction searches for the entity in the specified zones. The entity zone number $N$ must match the corresponding EntityN number.

| Type: | Long |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration |  |
| Section: | Any section that you have defined for Eduction settings |
| Example: | Entity0=edk_common_entities/ss_number <br> EntityField0=SOCIAL_SECURITY_NUMBER <br> EntityZone0=0 |
| Entity1=edk_common_entities/postal_address <br> EntityField1=SHIPPING_ADDRESS <br> EntityZone1=1 |  |
| Zee Also: | ZoneStart0=Social Security: <br> ZoneStart1=Shipping Address: |
| ZoneEnd1=Billing Address |  |

## LanguageDirectory

Enables tokenization of Chinese, Japanese, Korean, and Thai languages. Set LanguageDirectory to the path of an IDOL Server language directory that contains the relevant sentence breaking libraries and associated data files.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | C: $\backslash$ Program Files $\backslash$ IDOLServer $\backslash$ IDOL $\backslash$ langfiles |
| See Also: | Locale, below |

## Locale

Enables tokenization of Chinese, Japanese, Korean, and Thai languages. Set Locale to one of CHI, JPN, KOR, or THA.

## NOTE:

The standard grammar files are developed without this setting; HPE recommends that you use this parameter only when you are using custom grammar files that have been developed with the specific tokenization.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | Locale=THA |
| See Also: | LanguageDirectory , above |

## MatchCase

By default, Eduction is case sensitive when matching characters. This default value applies only when no grammar-specific case attribute has been specified for an entity.

To ignore case when matching characters, set this parameter to False.

| Type: | Boolean |
| :--- | :--- |
| Default: | True |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | MatchCase=False |
| See Also: |  |

## MatchTimeout

The maximum amount of time (in seconds) to spend searching for matches (to all chosen entities) at a specific offset. If the timeout is reached, Eduction SDK returns the best match it has found (if any) and continues looking for matches later in the text.

Eduction usually finds matches very quickly, so in most cases setting this timeout is not required.

| Type: | Integer |
| :--- | :--- |
| Default: | 60 |
| Required: | No |
| Configuration <br> Section: | Eduction |
| Example: | MatchTimeout=30 |
| See Also: |  |

## MatchWholeWord

To match only terms in the text that begin and end on a whole word boundary, set this parameter to True.

To match terms that start and end anywhere, including in the middle of a word in the text, set this parameter to False.
For example, if MatchWholeWord=True, a search for the term 80 does not find a match in the text string 80 mph . If MatchWholeWord=False, a search for the term par finds a match in the text string separated.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration | Any section that you have defined for Eduction settings. |

| Section: |  |
| :--- | :--- |
| Example: | MatchWholeWord=False |
| See Also: | TangibleCharacters, on page 122 <br> TokenWithPunctuation, on page 123 |

For more information on modifying the matching behavior by using MatchWholeWord, refer to IDOL Expert.

## MaxEntityLength

The maximum number of characters in a returned entry.
Reducing this number can assist performance by preventing Eduction from scanning a long string of text for an entity that is expected to be small.

| Type: | Integer |
| :--- | :--- |
| Default: | 256 |
| Allowed Range: | Minimum: 1 <br> Maximum: 1024 |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | MaxEntityLength=100 |
| See Also: | EntityN, on page 111 |

## MaxMatchesPerDoc

The maximum number of matches to allow in each document.

| Type: | Integer |
| :--- | :--- |
| Default: | Unlimited |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | MaxMatchesPerDoc=15 |
| See Also: |  |

## NonGreedyMatch

A Boolean that specifies whether to return the shortest match. To configure Eduction to return the shortest match, set NonGreedyMatch to True. If two matches from two different entities start at the same word, and NonGreedyMatch is set to True, Eduction returns only the shortest match.

Setting this parameter to True implicitly disables the AllowOverlaps and AllowMultipleResults parameters. If you have set these parameters, NonGreedyMatch takes precedence.

For more information on how to configure the Eduction matching behavior using NonGreedyMatch, refer to IDOL Expert.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | NonGreedyMatch=True |
| See Also: | AllowMultipleResults, on page 103 <br> AllowOverlaps, on page 104 |

## OutputScores

Set this parameter to True to include the score associated with a match in the output from an extraction task. If the output is in .IDX format, the score is added as a new DREFIELD, with the field name SCORE. If the output is in XML format, the score is added as an attribute with the name "score".

## NOTE:

This parameter is used by edktool only.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | OutputScores=True |
| See Also: |  |

## ProcessEnMasse

Configures an en masse post-processing task. If you set ProcessEnMasse to True, your postprocessing script takes the entire set of educed matches as its input argument, rather than a single match. The script can thus look at all the matches at once and modify them accordingly.

A Boolean that specifies whether to consider and modify all of the matches at the same time. For example, to increase the score of a match if it is found near other matches, you must consider all of the matches together.

- When ProcessEnMasse=False, the Lua post processing script takes an individual match as its input argument.
- When ProcessEnMasse=True, the Lua post processing script takes the entire set of matches as its input argument.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for an Eduction post processing task. |
| Example: | PostProcessingTask0=EductionLuaPostProcessing <br> [EductionLuaPostProcessing] <br> Script=scripts/eduction_post_process.lua <br> ProcessEnMasse=True |
| See Also: | Entities, on page 107 <br> Script , on page 121 |

## RedactedOutput

Set this parameter to True to enable redaction of sensitive information in the output text.
You can also set one of RedactionOutputString or RedactionReplacementCharacter ; if neither are set, the default behavior is to replace redacted text with [redacted] in the output. If both are configured, RedactionReplacementCharacter takes precedence.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |

| Example: | RedactedOutput=False |
| :--- | :--- |
| See Also: |  |

## RedactionOutputString

A string that replaces redacted information in the output text.

| Type: | String |
| :--- | :--- |
| Default: | [redacted] |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | RedactionOutputString=[censored] |
| See Also: |  |

## RedactionReplacementCharacter

A single character that replaces each character in redacted text.

| Type: | String |
| :--- | :--- |
| Default: | Use [redacted] instead. |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | RedactionReplacementCharacter=* |
| See Also: |  |

## ResourceFiles

The full path to a compiled ECR file containing Eduction grammar entries. At least one resource file is required.

You can specify multiple resource files either by separating them with commas, or by using wildcard expressions. You can use the * wildcard to match any number of characters, or the ? wildcard to match a single character. For example, set ResourceFiles to <grammar_files_directory>/sentiment_ *. ecr to use all available sentiment grammars without having to type a lengthy comma-separated list.
Type: String

| Default: | None |
| :--- | :--- |
| Required: | Yes |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | ResourceFiles=C: $\backslash$ MyGrammar $\backslash$ gram1.ecr, C: $\backslash$ MyGrammar $\backslash g r a m 2 . e c r ~$ |
| See Also: |  |

## Script

The path to the Lua script that you want to run to process the data returned by the Eduction module.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for an Eduction post processing task. |
| Example: | Script $=$./scripts/checksum. lua |
| See Also: | Entities, on page 107 <br> ProcessEnMasse , on page 119 |

## SearchFields

A comma-separated list of fields to search for entities, for example DRECONTENT or DRETITLE.
To search for a specific entity only in specific fields, you can set EntitySearchFieldsN, on page 113, which overrides the value of this parameter for specific entities.

You must search at least one field, otherwise Eduction does not return any results.

| Type: | String |
| :--- | :--- |
| Default: | DRETITLE, SUMMARY, DRECONTENT |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings |
| Example: | SearchFields=DRECONTENT, DRETITLE |
| See Also: | EntityN, on page 111 <br> EntitySearchFieldsN, on page 113 |

## SuppressMatchLogging

Set this parameter to True to suppress log entries for every entity and zone pattern found in a document.

When logging is set to Full in the Eduction configuration file, Eduction makes a log entry for every entity and zone pattern found in a document. If you set this parameter to True, these log entries are suppressed. This option is useful when you want to log the performance timing information, but do not want the verbose match entries.

You can also set this parameter in Eduction Server. If you set logging to Full in the Eduction Server configuration file, the server records a log entry for every entity match found. You can set SuppressMatchLogging to True to suppress these log entries.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | SuppressMatchLogging=True |
| See Also: |  |

## TangibleCharacters

A list of punctuation characters to treat as part of the word, rather than as word boundaries. By default almost all punctuation characters are treated as word boundaries.

## NOTE:

You cannot specify spaces, returns, and tabs as TangibleCharacters.
This parameter has no effect when MatchWholeWord is set to False.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | TangibleCharacters=-/八@ |
| See Also: | MatchWholeWord , on page 116 <br> TokenWithPunctuation, on the next page |

For more information on using TangibleCharacters to specify punctuation characters to match, or to match punctuation at the start of a match, refer to IDOL Expert.

## TokenWithPunctuation

A Boolean that specifies whether to treat all punctuation characters as part of a word token, rather than treating them as word boundaries. Setting this parameter to True is equivalent to setting the TangibleCharacters parameter to all punctuation characters.

This parameter has no effect when MatchWholeWord is set to False.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | TokenWithPunctuation=True |
| See Also: | MatchWholeWord, on page 116 <br> TangibleCharacters, on the previous page |

For more information on using TokenWithPunctuation to configure all punctuation marks as tangible characters, refer to IDOL Expert.

## ZoneEndN

A regular expression that defines the end point of the zone.
A zone is a section of a field defined by a starting and ending pattern. Zones locate entities in parts of a field. If you do not add zone entries, the entire field is matched for text. If the ending pattern is absent, the search begins at a match for the starting pattern and continues until the end of the field.

Use the EntityZoneN parameter to associate an entity identified in an EntityN parameter with one or more zones defined using the ZoneStartN and ZoneEndN parameters.

## NOTE:

You must choose start and end patterns that do not match the same text in a field.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings |
| Example: | ZoneStart0=Social Security: <br> ZoneEnd0=Shipping Address |

|  | ZoneStart1=Shipping Address: <br> ZoneEnd1=Billing Address |
| :--- | :--- |
| See Also: | EntityN, on page 111 <br> EntityZoneN, on page 114 <br> ZoneStartN, below |

## ZoneStartN

A regular expression that defines the starting point of the zone.
A zone is a section of a field defined by a starting and ending pattern. Zones locate entities in parts of a field. If you do not add zone entries, Eduction searches the entire field. If a starting pattern is absent, the search begins at the start of the field and ends with a match for the ending pattern.

Use the EntityZoneN parameter to associate an entity identified in an EntityN parameter with one or more zones defined using the ZoneStartN and ZoneEndN parameters.

NOTE:
You must choose start and end patterns that do not match the same text in a field.

| Type: | String |
| :--- | :--- |
| Default: | None |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings |
| Example: | ZoneStart0=Social Security: <br> ZoneEnd0=Shipping Address |
| ZoneStart1=Shipping Address: <br> ZoneEnd1=Billing Address |  |
| See Also: | EntityN, on page 111 <br> EntityZoneN, on page 114 <br> ZoneEndN, on the previous page |

## Configuration Parameters Used by edktool Only

The following parameters are used by edktool only, and are ignored by Eduction.

- EnableComponents ..................................................................................... 125
- OutputSimpleMatchInfo ............................................................................................. 125

## EnableComponents

Set this parameter to False to return only the entity. Set it to True to return the entity and all the components of the entity.

This parameter requires OutputSimpleMatchInfo to be set to False.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | EnableComponents=True |
| See Also: | OutputSimpleMatchinfo, below |

## OutputSimpleMatchInfo

When edktool is used with both the extract option and the option to generate a list of matches, setting OutputSimpleMatchInfo to True generates basic match information only, such as document, entity, position, and original text.

If OutputSimpleMatchInfo=True, the EnableComponents setting has no effect and reverts to False.

| Type: | Boolean |
| :--- | :--- |
| Default: | False |
| Required: | No |
| Configuration <br> Section: | Any section that you have defined for Eduction settings. |
| Example: | OutputSimpleMatchInfo=True |
| See Also: | EnableComponents, above |

## Match Validity

The order in which a match is assessed for its validity is as follows:

- If the match is not found inside one of the required zones, discard it.
- If the match does not meet the minimum score requirement, discard it.
- If duplicates are allowed:
- If the instance of the match is allowable, count this instance and return the match.
- Otherwise, count this instance and discard it.
- If duplicates are not allowed for the entity field:
- If the matched text has been found before, discard it.
- Otherwise, if the instance of the match is allowable, count this instance and return the matched text.
- If the instance of the match is not allowable, count this instance and discard it.

## Order of Returned Matches

When multiple fields in a document are selected for parsing, the field order in which matches are returned is as follows:

- DREREFERENCE
- DRETITLE
- DRECONTENT
- Any remaining fields in the order in which they are specified.

## Chapter 6: Standard Grammars

This chapter contains specific information concerning the standard grammars that come with Eduction.

- File Names ........................................................................................................................ 127
- Standard Grammar - Compiled ............................................................................................. 129
- Standard Grammar - Source ........................................................................................... 290

## File Names

File names consist of up to four parts:

- Basic entity type. For example, place, number, or person.
- Further detail on the basic type. For example, malefirstname or ss for Social Security number. This part is optional, and is preceded by an underscore.
- Language. The three-character ISO 639-2/B code in which the grammar was written. For example, eng for English. It is preceded by an underscore.
- Country. The two-character ISO 3166-1 code describing the country for which the grammar was written. For example: us for the United States. This part is optional if the grammar does not target a specific country (for example, a credit card number). It is preceded by an underscore.

## NOTE:

Entity names follow the same four-part structure, except for the basic type. The further detail and language/country parts are separated by forward slashes. The language code and the optional country code are concatenated.

## Sentiment Grammars

- Polarity Scoring ............................................................................................... 128
- Verb Sentiment Transitivity ...................................................................................... 128

Eduction includes standard grammars designed to identify those phrases in a passage of text that indicate positive or negative sentiment. These grammars can also identify which sentiments are expressed for which topics.

The sentiment grammar files also have 'lite' counterparts. These can process data up to twice as fast compared to the full versions, depending on language. The 'lite' versions are identical to the full versions in most respects, but they do not support components or user modification. HPE recommends that you use the 'lite' versions except in cases where you want to enable components or modify the built-in dictionaries.

The 'lite' versions are distinguished from the full versions by the addition of lite to the file name, preceded by an underscore. For example, the file name of the Chinese sentiment grammar file is sentiment_chi.ecr, and the file name of the 'lite' version is sentiment_chi_lite.ecr.

All sentiment analysis grammar files except sentiment_basic_eng.ecr now support components. You can extract the SENTIMENT and TOPIC components in most matches.

## Polarity Scoring

#### Abstract

The Arabic, Chinese, Czech, English, French, German, Italian, Polish, Portuguese, Russian, Spanish, and Turkish sentiment grammars (sentiment_ara.ecr, sentiment_chi.ecr, sentiment_cze.ecr, sentiment_eng.ecr, sentiment_fre.ecr, sentiment_ger.ecr, sentiment_ita.ecr, sentiment_ pol.ecr, sentiment_por.ecr, sentiment_rus.ecr, sentiment_spa.ecr, and sentiment_tur.ecr) support polarity scoring. This is a number, usually between 0.50 and 1.50 , that represents the strength of the sentiment in the matched phrase. For example:

- a strongly positive or negative phrase might have a score of 1.35
- a typical phrase might have a score of 1.00
- a match where the sentiment is weak or ambiguous might have a score of 0.60

You can edit the user modification files (sentiment_user_ara.xml, sentiment_user_chi.xml, sentiment_user_cze.xml, sentiment_user_eng.xml, sentiment_user_fre.xml, sentiment_ user_ita.xml, sentiment_user_pol.xml, sentiment_user_por.xml, sentiment_user_rus.xml, sentiment_user_spa.xml, and sentiment_user_tur.xml) to increase the scores of words in the dictionaries. For example, add the following on a new line in the user modification file to modify the existing entry flexible so that it has a score of 1.23 :

```
" <entry score="1.23" headword="flexible"/>"
```

NOTE:
sentiment_basic_eng.ecr does not support polarity scoring.

## Verb Sentiment Transitivity

The sentiment analysis files for Arabic, Chinese, Czech, English, French, German, Italian, Polish, Portuguese, Russian, Spanish, and Turkish (sentiment_ara_ecr, sentiment_chi.ecr, sentiment_ cze.ecr, sentiment_eng.ecr, sentiment_fre.ecr, sentiment_ger.ecr, sentiment_ita.ecr, sentiment_pol.ecr, sentiment_por.ecr, sentiment_rus.ecr, sentiment_spa.ecr, and sentiment_tur.ecr) support verb sentiment transitivity. This enables the TOPIC components of the matches to determine what the sentiment is about with more accuracy by using advanced contextual understanding of whether that sentiment is being expressed about the subject or object of the sentence. For example, given two matches, $x$ likes $y$ and $x$ wins at $y$, the grammar files can determine that the first match is a positive statement about $y$, whereas the second match is a positive statement about $x$.

## Place Name Disambiguation

Ambiguous names in all place grammars have been given a score of 0.98 so that you can filter them out by setting EntityMinScoreN to 0.99. For example, if you want to use the place/state/engau entity to extract Australian state names using the place_engau. ecr grammar file, you can set EntityMinScoreN to 0.99 to filter out ambiguous names such as Victoria.

## Standard Grammar - Compiled

The following sections list the compiled grammar files included with Eduction.

## NOTE:

All the Chinese grammar files support traditional Chinese.
A

| File | Entity | Description |
| :---: | :---: | :---: |
| address_au.ecr | address/postcode/au | Australian postal codes. For example, 2600. |
|  | address/state_postcode/au | Australia state or territory, and postal code. For example, NSW 2060. |
|  | address/city_state_postcode/au | Australian city, state or territory, and postal code. For example, North Sydney, NSW 2060. |
|  | address/au | Any Australian address. For example: <br> Shop 17, Winnellie Shopping Centre, 347 Stuart Hwy, Winnellie, NT, 0820. <br> P.O.Box 27, Armadale North, Victoria, 3143, AUSTRALIA. <br> 121 North Seal Way, Cocos Keeling Islands, WA, 6799. <br> Eduction supports all common delimiters, including newlines. |
| address_ca.ecr | address/postcode/ca | Canadian postal codes. For example, T2P-0B4, T2P0B4, or T2P $0 B 4$. |

| File | Entity | Description |
| :---: | :---: | :---: |
|  | address／region＿postcode／ca | Canadian province or territory，and postal code．For example，Alberta，T2P0B4． |
|  | address／city＿region＿postcode／ca | Canadian city，province or territory，and postal code．For example，Calgary，Alberta，T2P OB4． |
|  | address／ca | Any Canadian address．For example： 240 4th Avenue S．W．，Suite 600，Calgary，Alberta T2P 4H4，Canada． <br> 124 Av de la Peine，Montreal QC，H3Z 2 Y7． <br> Suite 600，222－3rd Ave S．W．，Calgary Alberta，T2P OB4． <br> Eduction supports all common delimiters，including newlines． |
| address＿cn．ecr | address／pc／chicn | Chinese postal code．For example， 266033. |
|  | address／chicn | Any Chinese address．For example，中国，山东省，青岛市 香港东路6号，5号楼，8号室李小方（先生）收。 |
|  | address／engcn | A Chinese address in English．For example． 63 Renmin Lu，Qingdao Shi， 266033 Shandong，China． |
|  | address／cn | A Chinese address in Chinese or English． |
| address＿de．ecr | address／postcode／de | German postal code．For example， 80639. |
|  | address／postcode＿city／de | German postal code，and city．For example，80639， München． |
|  | address／de | Any German address．For example： <br> Hewlett－Packard－Straße 1，61352，Bad Homburg vor der Höhe． <br> Postfach 1001 65，32547，Bad Oeynhausen， GERMANY． |

| File | Entity | Description |
| :---: | :---: | :---: |
|  |  | Grüner Weg 6, 61169, Friedberg, GERMANY. <br> Eduction supports all common delimiters, including newlines. |
| address_eng.ecr | address/strnum/eng | Street numbers. For example, 12a or 14-17B. |
|  | address/pobox/eng | Post office box numbers. For example, PO Box 26. |
|  | address/pmb/eng | Private mail box number. For example, Private Mail Box 26. |
|  | address/pmb_or_pobox/eng | Post office box or private mail box number. |
|  | address/street_pre/eng | Special street type that prefixes street numbers. For example, Highway Contract, HC. |
|  | address/street_hwy/eng | Highway. For example, City Route. |
|  | address/street_grid/eng | Grid address. For example, 400W350N. |
|  | address/street/eng | A street. For example, Cowley Road or 5th Street NW. |
|  | address/street_corner/eng | A street corner. For example, Corner King Street \& Queen Street. |
|  | address/street_all/eng | Any street For example, 12a Carlisle Lane. |
|  | address/suite/eng | Suite number. For example, Suite 1. |
|  | address/floor/eng | Floor or level number. For example, 3rd Floor, Second Floor, Level 8. |
|  | address/floor_or_suite/eng | A floor or suite number. |
|  | address/unitshipmil/eng | A military address analogous to a street address. |
|  | address/building/eng | A building. For example, Spear Tower. |

| File | Entity | Description |
| :---: | :---: | :---: |
| address_es.ecr | address/postcode/es | Spanish postal code. For example, 19208. |
|  | address/postcode_city/es | Spanish postal code and city. For example, 19208 Guadalajara. |
|  | address/es | Any Spanish address. For example: <br> Av. de las Cortes de Cádiz, s/n, C. C. El Corte Inglés, 11011, Cádiz. <br> Avda. Alfonso XIII, 6, Santander, España. <br> Calle de la Fundición, 3, 33206, Gijón, Spain. <br> Eduction supports all common delimiters, including newlines. |
| address_fr.ecr | address/postcode/fr | French postal codes. For example, 75008. |
|  | address/postcode_city/fr | French postal code, city, and optional CEDEX. For example, 75008, Paris. |
|  | address/fr | Any French address. For example: <br> 3, Avenue Denis Semeria, Saint-Jean-Cap-Ferrat, Provence-Alpes-Côte d'Azur, 06230, France. <br> 950 route des Colles - BP 27, 06901 Valbonne Sophia Antipolis. <br> Bât G1 147 r Oberkampf, 75011 PARIS. <br> Eduction supports all common delimiters, including newlines. |
| address_fre.ecr | address/strnum/fre | A street number. For example, 12a or 14-17B. |
|  | address/pobox/fre | Post office box number in French. For example, Boite Postale 26. |

| File | Entity | Description |
| :---: | :---: | :---: |
| address＿ger．ecr | address／strnum／ger | A street number．For example，12a． |
|  | address／pobox／ger | A post office box number in German．For example， Postfach 26. |
|  | address／street／ger | A street in German．For example， 12 Romanstr． |
| address＿it．ecr | address／postcode／it | Italian postal code．For example， 12345 or IT－98765． |
|  | address／postcode＿city／it | Italian postal code and city．For example， 52100 Arezzo． |
|  | address／it | Any Italian address．For example： Strada del Masarone 67， 13900 Biella（MI）． <br> Via Balbi 3 e 4016126 Genova． <br> Via Mascarella $n^{\circ}$ 21／3， 40131 Bologna，Italia． <br> Eduction supports all common delimiters，including newlines． |
| address＿ita．ecr | address／strnum／ita | Italian street number．For example，12a． |
|  | address／pobox／ita | A post office box number in Italian．For example，Casella postale 26. |
|  | address／street＿type／ita | A street type in Italian．For example，Via or Lungomare． |
|  | address／street／ita | An entire street name in Italian．For example，Via del Fosso de Dragoncello． |
| address＿p．ecr | address／postcode／jp | Japanese postal code．For example，青森市． |
| address＿spa．ecr | address／strnum／spa | A street number．For example，12a or 14－17B． |
|  | address／pobox／spa | A post office box number in Spanish．For example， Apartado de correos 26. |

| File | Entity | Description |
| :---: | :---: | :---: |
|  | address/street_type/spa | A street type in Spanish or in another language spoken in Spain. For example, Calle or Passeig. |
|  | address/street_name/spa | A Spanish name that may refer to a street. For example, 26 de Marzo de 1824 or Trujillo. These are often used for street names in South America without a street type such as Calle. |
|  | address/street/spa | An entire street name in Spanish. For example, Calle de La Habana. |
|  | address/business_area/spa | A shopping centre or business park in Spanish. For example, Parque Tecnológico de Andalucía. |
| address_us.ecr | address/zipcode/us | U.S. ZIP codes. For example, 94070-1234. |
|  | address/city_state_zipcode/us | U.S. city, state, and ZIP code. For example, Chicago, IL 80803. |
|  | address/military/us | U.S. military address. For example, Unit 45013, Box 2666, USAG J, APO AP 96338. |
|  | address/us | Any U.S. address. For example: <br> 30 South Wacker Drive, 22nd Floor, Chicago, IL 60606. <br> P.O. Box 29, Sometown, AL 12345. <br> 5758 West Las Positas Blvd, Suite 100, Pleasanton, CA 94588. <br> 1 Market Street, Spear Tower, Suite 1900, San Francisco, CA 94105. <br> Eduction supports all common delimiters, including newlines. |
| age_eng.ecr | age/all/eng | An age in English. |

| File | Entity | Description |
| :--- | :--- | :--- |
| age_fre.ecr | age/all/fre | An age in French. |

## B

| File | Entity | Description |
| :--- | :--- | :--- |
| bank.ecr | bank/engca | Canadian banks. For example, Canadian Imperial Bank <br> of Commerce. |
|  | bank/engb | UK banks. For example, HSBC. |
|  | bank/engus | U.S. banks. For example, Morgan Stanley. |

C

| File | Entity | Description |
| :--- | :--- | :--- |
| company_chicn.ecr | company/all/chicn | Any Chinese company. |
| company_dutnl.ecr | company/top500/dutnl <br> company/designator/dutnl <br> company/law/engau <br> company/tsx60/engca <br> company/TSXVenture50/engca <br> company/all/engca | Top 500 Dutch companies. <br> Autch company identifiers. |
| company_engau.ecr | Law firms in Australia. |  |
| Any Canadian TSX Venture 50 company. |  |  |
| matched by the other entities in this section, as well as several |  |  |
| hundred other significant companies. |  |  |

| File | Entity | Description |
| :--- | :--- | :--- |
|  | company/law/enggb <br> company/ftse100/enggb <br> company/all/enggb | Law firms in the United Kingdom. <br> A FTSE 100 United Kingdom company. <br> Any United Kingdom company. This entity includes all companies <br> matched by the other entities in this section, as well as dozens of <br> other significant companies. |
| company_engjp.ecr | company/nikkei225/engjp <br> company/all/engjp | A Nikkei225 Japanese company. <br> Any Japanese company. This entity includes all companies <br> matched by the other entities in this section, as well as several <br> hundred other significant companies. |
| company_engus.ecr | company/fortune_1000_2008/engus <br> company/sp500/engus <br> company/major_company/engus <br> company/law/engus <br> company/fortune_500/engus <br> company/forbes_largest_private_ <br> companies2010/engus <br> company/all/engus | The 2008 list of Fortune 1000 companies. <br> U.S. S\&P 500 companies. <br> Major U.S. companies. <br> Law firms in the United States. |
| company_frefr.ecr | A company that has featured in the Fortune 500 list at any time <br> since 2011. |  |
| The 2010 list of Forbes largest companies. |  |  |

| File | Entity | Description |

| university.ecr | org/university | A university. |

## Standard Grammar - Source

Eduction includes standard grammar files in source form (XML) and their compiled equivalents (ECR). The source files import compiled Eduction standard grammar files and illustrate sample usage. Customers can modify these XML source files and recompile them to customize a grammar for the needs of an Eduction application. The following table lists public entities defined in the XML source files. It excludes the public entities that are republished from the imported Eduction ECR grammar files

| File | Entity | Description |
| :---: | :---: | :---: |
| measure.xml | measure/all/eng | An editable collection of patterns that match length, area, volume, and mass. |
| money.xml ${ }^{1}$ | money/all | All currency amounts. <br> NOTE: <br> This grammar file supports some English alphabetic numbers, for example, seven cents, $\$ 12$ million, one hundred dollars, $£ 5 m$. |
| pci_dss.xml | ```pci_dss/person_ name/engus pci_dss/date/engus pci_dss/credit_card/engus pci_dss/bank_ names/engus``` | Person names. <br> Dates. <br> Credit and debit card numbers. <br> Bank names. |
| pii.xml | pii/person_name/engus <br> pii/phone_number/engus <br> pii/email_address/engus | Personal names. <br> Phone numbers. <br> Email addresses. |

${ }^{1}$ When matching symbols in the money entities, the Eduction option MatchWholeWord must be set to 0 (false). Otherwise, when encountering a string such as $\$ 10.70$, Eduction will not recognize that $\$$ is the start of a token. Instead, it looks only for matches starting on the 1 and on the 7 , and will not return $\$ 10.70$.

| File | Entity | Description |

The entities above incorporate the compiled Eduction entities in combination with Eduction XML grammar to create additional entities. The XML illustrates how to use the compiled Eduction entities. You can modify these XML files and compile them into Eduction ECR files that can then be used for specific applications.

The Eduction grammar files have three advantages:

- Allows for fined-grained access to basic entities that include more complex entities. Allows you to customize the complex entities to increase the precision and recall of the matching process.
- Provides both the compiled ECR grammar files as well as source-form XML grammar files that reference them.
- Separate ECR files reduce the memory footprint and file size.

## Chapter 7: Grammar Reference

## Eduction uses Grammar files to identify and tag entities in documents. They are written in XML in a

 format specific to Eduction. They are then compiled, using the Eduction command-line tool, into ECR files that Eduction can easily read at runtime. Eduction includes a collection of standard grammar files that make it easy to identify common entities such as names and phone numbers. These are described in.- Create and Edit Grammar Files ..... 297
- Example Grammar Files ..... 309
- Eduction Grammar DTD ..... 312

- Token Properties ..... 309

An Eduction grammar defines patterns for matching text in a document. A pattern is a combination of characters and operators. An operator is a sequence of special characters that match text by following the rules associated with the operator.

| Pattern | Description | Matches |
| :--- | :--- | :--- |
| Smith\|John | Match either Smith or John | Smith |

| Pattern | Description | Matches |
| :--- | :--- | :--- |
|  |  | John |
| $[0-9]\{3\}$ | Match a sequence of three characters in the range 0 through 9 | 123 |
|  |  | 456 |

In the above example, the square bracket operators [] are used to match on any of the characters 0 through 9 and the curly braces $\}$ are used to repeat the previous pattern three times.

Grammars are described using XML. The template that defines the XML that Eduction understands is contained in the file edk. dtd. When writing grammars for Eduction, HPE recommends that you reference edk. dtd at the start of the XML grammar file using the include statement, and that you use a DTD-compatible XML authoring tool to eliminate syntax errors and save time.

Here is an example of a simple Eduction grammar:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE grammars SYSTEM "edk.dtd">
<grammars>
    <grammar name="mygrammar">
        <entity name="name" type="public">
            <pattern>Smith|John</pattern>
        </entity>
        <entity name="digits" type="public">
            <pattern>[0-9]{3}</pattern>
        </entity>
    </grammar>
</grammars>
```

This grammar defines two entities: mygrammar/name and mygrammar/digits.
For a more extensive set of example Eduction grammar files, see Example Grammar Files, on page 309.

## Compile Grammars

After a grammar is written, compile the XML file into an ECR file using the Eduction command-line tool edktool. XML files are easy for people to read, but inefficient for computers to process. edktool transforms the XML file into an ECR file that is efficient for Eduction to use directly. An example of the edktool compile command is:
edktool c mygrammar.xml
This command produces the output file mygrammar.ecr.

## Eduction Grammar Syntax

- <grammars> .............................................................................................. 299
- <include>
- <publish> ..... 300
- <grammar> ..... 300
- <extern> ..... 301
- <entity> ..... 301
- <entry> ..... 302
- <headword> ..... 303
- <synonym> ..... 304
- <pattern> ..... 304

The tables in this section describe the Eduction grammar syntax defined in the edk. dtd (see Eduction Grammar DTD, on page 312).

In the tables, terms shown in italics are deprecated, but are kept for backward compatibility. The terms in angled brackets <> describe the value that must be inserted. Note that the XML elements, attributes, and values are defined in lower case. Although the Eduction compiler accepts uppercase element and attribute names, this functionality is deprecated, but retained for backward compatibility. The edk.dtd file represents the current definition for Eduction grammar files, and must be followed for all Eduction grammars.

NOTE:
Two deprecated elements are missing from the tables below: dictionary and entryset. These are synonymous with grammar and entity respectively, and, although not documented, are retained for backward compatibility.

## <grammars>

Element: grammars
Child Elements: include, grammar
Description: This is the top-level element in an Eduction grammar.
Example: <grammars version="1.0" debug="true" case="sensitive">

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| version | <version <br> string> | none | An optional character string providing version information for <br> the grammar. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> O/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited takes the value from the application level, which in <br> the case of Eduction applications is usually sensitive. |
| debug | true <br> 1/on/yes/true | false | Displays verbose information for the grammars element while <br> edktool compiles the grammar. |

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
|  | false |  |  |
|  | O/off/no/false |  |  |

## <include>

Element: include
Child Elements: publish
Description: References another Eduction grammar file for inclusion.
Example: <include path="winter_names.ecr" type="private"/>

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| path | <path to <br> the <br> grammar <br> file> |  | A value is required. |
| type | public <br> private | public | The default setting of public allows entities in included XML <br> grammars to retain their private/public visibility. (Included ECR <br> grammars, by definition of a compiled grammar, only contain public <br> entities.) Setting the type attribute to private hides the included <br> public entities from being visible in the file that includes the <br> grammar. |

## <publish>

## Element: publish

Child Elements: <none>
Description: Makes a private entity public. The entity can be anywhere in an included XML file chain. Note that private entities cannot be accessed in a compiled ECR file, so that even if the name of the private entity is known, publish is not able to make it public.

Example: <publish name="grammar2/g2e2"/>

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| name | <entity <br> name> |  | Makes a private entity in an included XML file public. A value is <br> required. |

## <grammar>

## Element: grammar

Child Elements: extern, entity
Description: Defines a grammar, which is a collection of entities. Entities are used for matching.

Example: <grammar name="grammar1" case="inherited" extend="disallow" debug="inherited">

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| name | <grammar <br> name> |  | A value is required. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> 0/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited accepts the case matching mode of the grammars <br> parent. |
| extend | append <br> replace <br> disallow | disallow | Extends or replaces an existing grammar definition, or <br> disallows this if one already exists. |
| debug | true <br> 1/on/yes/true <br> false <br> 0/off/no/false <br> inherited | inherited | Displays verbose information for the dictionary element during <br> compilation. The value inherited accepts the debug mode of <br> the grammars parent. |

## <extern>

## Element: extern

Child Elements: <none>
Description: Identifies an external grammar by name so that the entities contained by the grammar do not have to explicitly name the grammar. For example, if another grammar is grammar1 and an entity within it is entity1, then in the current grammar, the entity can be referred to as simply entity1 rather than grammar1/entity1.

Example: <extern name="grammar2"/>

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| name | <grammar name> |  | Identifies the name of the grammar. A value is required. |

## <entity>

Element: entity
Child Elements: entry, pattern
Description: Defines an entity used for matching.

Example: <entity name="entity1" type="public" case="insensitive" extend="disallow" debug="true">

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| name | <grammar <br> name> |  | A value is required. |
| type | public <br> private | private | Defines the entity as public or private. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> 0/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited accepts the case matching mode of the grammars <br> parent. |
| extend | append <br> replace <br> disallow | disallow | Extends or replaces an existing entity definition. |
| debug | true <br> 1/on/yes/true <br> false <br> 0/off/no/false <br> inherited | inherited | Displays verbose information for the entity element during <br> compilation. The value inherited accepts the debug mode of <br> the grammar parent. |

## <entry>

## Element: entry

Child Elements: headword, synonym
Description: An entry represents an individual entry that is matched in an entity. The entry has one or more attributes such as the actual phrase that is returned (the headword), the case, and so on.

Example:<entry headword="mat" score=".3" case="inherited" debug="inherited">

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| headword | \#CDATA |  | The dictionary entry. Headword can be an attribute or a <br> subelement, but it must be one or the other. |
| score | $>=0$ | 1 | Can be used to assign any weightings to the matches. <br> - A score of 1 is the default score. <br> - A score of 0 always excludes the matching tag from the |

| Attribute | Value | Default | Description |
| :---: | :---: | :---: | :---: |
|  |  |  | results, and can be used to specify exceptions to grammar rules. <br> You can use these weightings for a variety of purposes: <br> - They can represent the confidence the grammar author has in the accuracy of the match (where a value of 1 represents certainty, and lower values represent lesser confidence). <br> - They can represent the importance of a match - for example, in the sentiment grammars the scoring represents the strength of the sentiment in the match. <br> Multiple scores are multiplied. For example, if a match on an entity has a score of 1.5 , and that entity is used in another entity that also has a score of 0.4 , the resulting score is 0.6 . <br> If a minimum score is specified during extraction, only those matches with a sufficiently high score are extracted. You can also display the exact scores of any match during extraction. <br> NOTE: <br> Entries and patterns should be assigned a score no lower than 0.01 and no higher than 100. |
| case | sensitive <br> 1/on/yes/true insensitive 0/off/no/false inherited | inherited | Determines whether a match is case sensitive. The value inherited accepts the case matching mode of the entryset parent. |
| debug | true <br> 1/on/yes/true <br> false <br> 0/off/no/false <br> inherited | inherited | Displays verbose information for the entry element during compilation. The value inherited accepts the debug mode of the entryset parent. |

## <headword>

Element: headword
Child Elements: <none>
Description: A headword is the sequence of characters that produce an entity match.
Example: See example in <entry>, on the previous page.

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| <element <br> contents> | <the <br> headword> |  | The headword value. Note that if the entry element <br> contains a headword attribute, it cannot have a headword <br> subelement. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> 0/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited accepts the case matching mode of the entry <br> parent. |
| score | $>=0$ | 1 | See description in <entry>, on page 302. |

## <synonym>

## Element: synonym

## Child Elements: <none>

Description: A synonym is an alternative sequence of characters to a headword. Synonym matching produces an entity match, but returns the headword in place of the matching synonym. For example, if you search for $d o g$ with the synonym canine enabled, matches for canine return as if they matched dog.

## Example:

```
<entry headword="Vatican City">
    <synonym>The Vatican</synonym>
    <synonym>Holy See</synonym>
    <synonym>Città del Vaticano</synonym>
    <synonym>Citta del Vaticano</synonym>
</entry>
```

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| <element <br> contents> | <the <br> synonym> |  | The synonym value. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> O/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited accepts the case matching mode of the entry <br> parent. |

## <pattern>

Element: pattern
Child Elements: <none>

Description: Defines a pattern used for matching.
Example: <pattern score=".1" case="insensitive" replace="replacechars" insert_ before="prefix_" insert_after="_suffix">cat</pattern>

| Attribute | Value | Default | Description |
| :--- | :--- | :--- | :--- |
| pattern | <actual <br> pattern> |  | A value is required. |
| score | >=0 | 1 | See description in <entry>, on page 302. |
| case | sensitive <br> 1/on/yes/true <br> insensitive <br> 0/off/no/false <br> inherited | inherited | Determines whether a match is case sensitive. The value <br> inherited accepts the case matching mode of the grammars <br> parent. |
| replace | <text to <br> replace the <br> match> | <no <br> default> | The matched text is replaced with the specified text. |
| insert_- <br> before | <text to insert <br> before the <br> match> | <no <br> default> | Matched text is prefixed with the specified text. |

## Regular Expressions

This section describes the regular expressions syntax that Eduction supports.
The engine's parser interprets regular expression syntax nearly identically to the UNIX regular expression syntax. The engine's regular expression syntax also includes some extensions for matching substrings.

## Operators

The following table the base regular expression operators available in the Eduction engine and the pattern the operator matches.

| Operator | Matched Pattern |
| :---: | :---: |
| $\backslash$ | Quote the next metacharacter. |
| $\wedge$ | Match the beginning of a line. |
| \$ | Match the end of a line. |
| - | Match any character (except newline). |
| 1 | Alternation. |
| () | Used for grouping to force operator precedence. |
| [xy] | The character x or y . |
| [ $\mathrm{x}-\mathrm{z}$ ] | The range of characters between x and z . |
| [^z] | Any character except $z$. <br> NOTE: <br> For performance reasons, HPE recommends that you explicitly list all the characters that you want to match, rather than using this operator. <br> NOTE: <br> To use negated character classes in case-insensitive entities, you must include letters in both cases, for example [^Zz] rather than [^z]. |

## Quantifiers

| Operator | Matched Pattern |
| :--- | :--- |
| $*$ | Match 0 or more times. |
| + | Match 1 or more times. |
| $?$ | Match 0 or 1 times. |
| $\{n\}$ | Match exactly $n$ times. |
| $\{n\}$, | Match at least $n$ times. |
| $\{n, m\}$ | Match at least $n$ times, but no more than $m$ times. |

## Metacharacters

| Operator | Matched Pattern |
| :--- | :--- |
| $\backslash t$ | Match tab. |
| $\backslash n$ | Match newline. |

| Operator | Matched Pattern |
| :---: | :---: |
| \r | Match return. |
| \f | Match formfeed. |
| \a | Match alarm (bell, beep, and so on). |
| \e | Match escape. |
| Iv | Match vertical tab. |
| $\backslash 021$ | Match octal character (in this example, 21 octal). |
| \xF0 | Match hex character (in this example, F0 hex). |
| \x\{263a\} | Match wide hex character (Unicode). |
| \w | Match word character: [A-Za-z0-9_]. |
| \W | Match non-word character: [^A-Za-z0-9_]. |
| \s | Match whitespace character. This metacharacter also includes $\backslash n$ and $\backslash r$ : [ $\backslash t \backslash n \backslash r]$. |
| \s | Match non-whitespace character: [^ \t $\backslash \mathrm{n} \backslash \mathrm{r}$ ]. |
| \d | Match digit character: [0-9]. |
| \D | Match non-digit character: [^ө-9]. |
| $\backslash \mathrm{b}$ | Match word boundary. |
| $\backslash \mathrm{B}$ | Match non-word boundary. |
| $\backslash \mathrm{A}$ | Match start of string (never match at line breaks). |
| $\backslash Z$ | Match end of string. Never match at line breaks; only match at the end of the final buffer of text submitted for matching. |

## Extensions

| Operator | Matched Pattern |
| :--- | :--- |
| (?A: |  |
| entity) | Match a previously defined entity, which is then copied into the new entity's definition. |
| For example: |  |
|  | include path="number_types_eng.ecr"/> <br> <entity name="fracpos" type="private"> <br> <pattern>(?A:number/fracalpha/eng)</pattern> <br> </entity> |
|  | Copying an entity improves pattern execution speed, but increases compilation time and <br> memory usage. It is recommended unless the copied entry is large and is copied |
|  |  |

| Operator | Matched Pattern |
| :---: | :---: |
|  | multiple times. |
| $\begin{aligned} & \text { (?A^ } \\ & \text { entity) } \end{aligned}$ | Match a previously defined entity, which is then referenced by the new entity. <br> Referencing an entity minimizes the size and memory usage of the grammar, but decreases performance. The performance impact can vary from unnoticeable to significant, depending on the size and structure of the grammar. |
| $\begin{aligned} & \text { (?A! } \\ & \text { expr) } \end{aligned}$ | Match the expression expr but exclude its output. Designates an expression that helps identify an entity, but is not part of it. ```For example: <grammars> <grammar name="person"> <entity name="age" type="public"> <pattern>(?A!Age:\s)[1-9][0-9]?</pattern> </entity> </grammar> </grammars>``` If this grammar is used to search the text Name: Simon. Age: 32. Address. 12 Fifth Street, Las Vegas. the text 32 is returned but 12 is ignored because it does not have the prefix "Age:", which is matched upon but excluded from the output. |
| (?A= componen t:expr) | Define a component within an entity's definition. A component is a named part of an entity. <br> For example, the following grammar defines areacode and main as components: ```<grammars> <grammar name="number"> <entity name="phone" type="public"> <pattern>(?A=areacode:[0-9]{3})-(?A=main:[0-9]{3}-[0-9]{4}) </pattern> </entity> </grammar> </grammars>``` <br> If the data is as follows <br> The phone number is 408-555-1342. <br> and the following configuration options are set <br> <OutputSimpleMatchInfo>false</OutputSimpleMatchInfo> <br> <EnableComponents>true</EnableComponents> <br> then the output displays the areacode value 408 and the main value 555-1342 separately. |

## Token Properties

## CAUTION:

Token properties will be deprecated in a future release. Users should use the equivalent explicit regular expresions instead of token properties.

| Operator | Match Pattern |
| :--- | :--- |
| (?A: <br> \{properties \}) | Matches a token that satisfies the list of properties provided. The properties are <br> specified in a comma-separated list of one or more of the following: <br> - num, alpha_num <br> - all_caps, mixed_case, capword <br> Any of these properties can be prefixed with the negation operator '!' for <br> exclusion. |

## Example Grammar Files

The following sample grammar files contains the gram_edk_place.xml grammar.

- grammar.xml .................................................................................................... 309
- grammar_include.xml ....................................................................................... 310
- Example Grammar File to Match Months ................................................................. 310
- Simplified Grammar File Containing a Dictionary of Place Names .................................... 311
- Simplified Grammar File Containing Patterns to Match Times of Day .................................. 312

## grammar.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE grammars SYSTEM "../published/edk.dtd">
<!-- Sample Eduction grammar file showing all elements and attributes in the DTD --
>
<grammars debug="true" case="sensitive">
    <include path="grammar_include.xml" type="private">
        <publish name="grammar2/g2e2"/> <!-- publish previously private entity -->
    </include>
    <grammar name="grammar1" case="inherited" extend="disallow" debug="inherited">
        <extern name="grammar2"/> <!-- removes the need to refer explicitly to grammar2
-->
        <entity name="entity1" type="public" case="insensitive" extend="disallow"
debug="true">
        <!-- the following entity definitions are not useful but are provided only to
illustrate the options and combinations of elements and attributes available -->
        <pattern score=".1" case="insensitive" replace="replacechars" insert_
```

```
before="prefix_" insert_after="_suffix">cat</pattern>
    <pattern score=".2">sat</pattern>
    <entry headword="mat" score=".3" case="inherited" debug="inherited">
        <synonym case="inherited">rug</synonym> <!-- will locate rug but return mat -
->
            <!-- will locate rug but return mat -->
            <synonym case="inherited"><![CDATA[carpet]]></synonym> <!-- illustrates
allowing CDATA in this element -->
            </entry>
            <entry headword="dog" score=".6"/>
            <entry>
                    <headword score=".8"><![CDATA[rabbit<hi!>&abc&amp;]]></headword>
                    <synonym>bunny</synonym>
            </entry>
        </entity>
        <entity name="entity2" type="public">
            <pattern>(?A:g2e1)</pattern>
        </entity>
    </grammar>
</grammars>
```

## grammar_include.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE grammars SYSTEM "../published/edk.dtd">
<grammars>
    <grammar name="grammar2">
        <entity name="g2e1">
            <pattern>animal</pattern> <!-- default visibility -->
        </entity>
        <entity name="g2e2" type="private"> <!-- explicitly private -->
            <pattern>mineral</pattern>
        </entity>
        <entity name="g2e3" type="public"> <!-- explicitly public -->
            <pattern>vegetable</pattern>
        </entity>
    </grammar>
</grammars>
```

## Example Grammar File to Match Months

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE grammars SYSTEM "../published/edk.dtd">
<grammars version="4.0">
    <include path="winter_names.ecr" type="private"/>
    <grammar name="example">
```

```
<entity name="spring_month" type="private">
    <pattern>[Mm]ar(ch|\.)</pattern>
    <entry headword="April"/>
    <entry headword="april"/>
    <entry headword="Apr"/>
    <entry headword="apr"/>
    <entry headword="Apr."/>
    <entry headword="apr."/>
    <pattern replace="May">[Mm]ay\.?</pattern>
    <entry headword="June">
            <synonym>Jun</synonym>
            <synonym>Jun.</synonym>
            <synonym>june</synonym>
            <synonym>jun</synonym>
            <synonym>jun.</synonym>
        </entry>
                </entity>
                <entity name="summer_month" type="private" case="insensitive">
    <entry headword="June"/>
    <entry headword="July"/>
    <entry headword="August"/>
    <entry headword="September"/>
</entity>
<entity name="month" type="public">
    <pattern>(?A^spring_month)</pattern>
    <pattern>(?A:summer_month)</pattern>
    <entry headword="September"/>
    <entry headword="October"/>
    <entry headword="November"/>
    <entry headword="December"/>
    <pattern>(?A^winter_month)</pattern>
    <!-- spelling mistakes -->
    <entry score="0.5" headword="Febuary"/>
</entity>
    </grammar>
```

</grammars>

## Simplified Grammar File Containing a Dictionary of Place Names

## NOTE:

The following grammar file is a simplified version provided for example purposes, rather than actual source code.

```
<entity name="city/spain" type="public">
    <entry headword="Barcelona"/>
```

```
    <entry headword="Ciudad Real"/>
    <entry headword="Granada"/>
    <entry headword="Madrid"/>
</entity>
<entity name="city/germany" type="headword">
    <entry headword="Berlin"/>
    <entry headword="Frankfurt"/>
    <entry headword="München"/>
    <entry headword="Leipzig"/>
</entity>
```

## Simplified Grammar File Containing Patterns to Match Times of Day

NOTE:
The following grammar file is a simplified version provided for example purposes, rather than actual source code

```
<entity name="time_24_hour" type="public">
```

    <pattern>[01][0-9]:[0-5][0-9]</pattern>
    <pattern>2[0-3]:[0-5][0-9]</pattern>
    </entity>
<entity name="time_all" type="public">
<pattern>(?A:time_24_hour)</pattern>
<entry headword="Midnight"/>
<entry headword="midnight"/>
<pattern>([1-9]|10|11|12) ?[ap]\.?m \.?</pattern>
</entity>

## Eduction Grammar DTD

The XML DTD describing the Eduction grammar (such as, edk.dtd) is as follows:

```
<!ELEMENT grammars (include*, grammar*)>
<!ATTLIST grammars

Programming Guide

## Appendix 1: Eduction Lua Methods Reference

This section describes the methods and parameters that you can use in your Lua post-processing scripts.

| Method | Description |
| :--- | :--- |
| addComponent | Adds a new component to the match. |
| getComponent | Returns a specific component. |
| getComponentCount | Returns the total number of components in a match. |
| getEntityName | Returns the name of an entity in a match. |
| getMatchedText | Returns the input text for a match. |
| getName | Returns the name of a component. |
| getOffset | Returns the position of a match (in bytes). |
| getOffsetLength | Returns the output text for a match. |
| getOutputText | Returns the score of a match. |
| getScore | Returns the text that is matched by a component. |
| getText | Edits an entity name in a match. |
| setEntityName | Edits the input text for match. |
| setMatchedText | Edits the name of a component. |
| setName | Edits the position of a match (in bytes). |
| setOffset | Edits the position of a match (in bytes). |
| setOffsetLength | Assigns a new value to the output text for a match. |
| setOutputText | Edits the score of a match. |
| setScore | Edits the text that is matched by a component. |
| setText |  |

## addComponent

Adds a new component to the match. For example, if your Eduction task returns an email address as a match, you can use addComponent to extract the text after the @ symbol and add it as a DOMAIN component for the match.

You can also use addComponent to add metadata from other sources. For example, if you have extracted a place name, you can add components called "LATITUDE" and "LONGITUDE", and populate them with data from a different source, regardless of the fact that they were not components of the original text.

## Syntax

```
edkmatch:addComponent(name, offset, offsetLength)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| name | The name of the new component (for example, TOPIC, or SENTIMENT) |
| offset | The position of the text in the match to use as the new component (in bytes). |
| offsetLength | The position of the text in the match to use as the new component (in <br> characters). |

## NOTE:

If you are unsure of the correct offset or offsetLength, you can specify offset=0 or offsetLength=0.

## Returns

The new empty component object.

## Related Topics

- getName, on page 318
- setName, on page 321
- getText, on page 320
- setText, on page 323

## getComponent

The getComponent method returns a specified component object. For example, if you have six components, you can return the fourth component by using edkmatch:getComponent(4).

NOTE:
Lua index values start from 1 , not from 0 as in most other programming languages. For example, to get the third component object in a list, you must enter edkmatch:getComponent (3).

## Syntax

```
edkmatch:getComponent(index)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| index | The number of the component to get. |

## Returns

The component object at the specified index position in the match.

## Related Topics

- getName, on the next page
- setName, on page 321
- getText, on page 320
- setText, on page 323

## getComponentCount

Returns the total number of components in a match.

## Syntax

edkmatch:getComponentCount()

## Returns

The number of components.

## getEntityName

Gets an entity name from a match.

## Syntax

```
edkmatch:getEntityName()
```

## Returns

The name of the entity in a match. You can use setEntityName to edit the name.

## getMatchedText

Returns the input text for a particular match, that is, the text before any normalization or modification that occurs as part of the extraction process.

## Syntax

edkmatch:getMatchedText()

## Returns

The input text for a match. You can use setMatchedText to edit the text.

## Related Topics

- getOutputText, on the next page

## getName

Retrieves the name of a component.

## Syntax

edkcomponent:getName()

## Returns

The component name. You can use setName to edit the component name.

## getOffset

Provides information on where in a document a particular match is found.

## Syntax

edkmatch:getOffset()

## Returns

The position of the match, in bytes. You can use setOffset to edit this information.

## getOffsetLength

Provides information on where in a document a particular match is found.

## Syntax

edkmatch:getOffsetLength()

## Returns

The position of the match, in characters. You can use setOffsetLength to edit this information.

## getOutputText

Returns the output text for a match, that is, the text after any normalization or modification that takes place as part of the extraction process.

## Syntax

edkmatch:getOutputText()

## Returns

The output text of a match. You can use setOutputText to edit the text.

## Related Topics

- getMatchedText, on the previous page

## getScore

Retrieves the score for a match.

## Syntax

edkmatch:getScore()

## Returns

The score for the match. You can use setScore to edit the score.

## getText

Returns the output text that is matched by a particular component.

## Syntax

```
edkcomponent:getText()
```

## Returns

The matched text for a specified component. You can use setText to edit the text.

## setEntityName

Edits the name of the entity that you retrieved by using getEntityName.

## Syntax

```
edkmatch:setEntityName(new_name)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| new_name | The new name for the entity in the match. |

## Returns

The new entity name.

## setMatchedText

Edits the input text that you retrieved by using getMatchedText.
The input text is the text before any normalization or modification that takes place as part of the extraction process. By contrast, setOutputText enables you to edit the output text after any changes.

## Syntax

edkmatch:setMatchedText(new_text)

## Arguments

| Argument | Description |
| :--- | :--- |
| new_text | The new value that you want to assign to the input text. |

## Returns

The new input text.

## setName

Edits the name of the component that you retrieved with getName.

## Syntax

```
edkcomponent:setName(new_name)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| new_name | The new name for the component. |

## Returns

The new component name.

## setOffset

Edits the position of a match in a document.

## Syntax

edkmatch:setOffset(new_offset)

## Arguments

| Argument | Description |
| :--- | :--- |
| new_offset | The new position of the match (in bytes). |

## Returns

The new position of the match (in bytes).

## Related Topics

- getOffset, on page 318

## setOffsetLength

Edits the position of a match in a document.

## Syntax

```
edkmatch:setOffsetLength(new_length)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| new_length | The new position of the match (in characters). |

## Returns

The new position of the match (in characters).

## setOutputText

Edits the output text that you retrieved by using getOutputText.
The output text is the text after any normalization or modification that takes place as part of the extraction process. By contrast, setMatchedText enables you to edit the input text before any changes are made.

## Syntax

```
edkmatch:setOutputText(new_text)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| new_text | The new value that you want to assign to the output text for a match. |

## Returns

The new output text.

## setScore

Edits the match score that you retrieved with getScore.

## Syntax

edkmatch:setScore(new_score)

## Arguments

| Argument | Description |
| :--- | :--- |
| new_score | The new score for the match. |

## Returns

The new score for the match.

## setText

Edits the matched text for a particular component that you retrieved with getText.

## Syntax

```
edkcomponent:setText(new_text)
```

## Arguments

| Argument | Description |
| :--- | :--- |
| new_text | The new matched text for the component. |

## Returns

The new matched text for the specified component.

Programming Guide

## Glossary

## A

ACI (Autonomy Content Infrastructure)
A technology layer that automates operations on unstructured information for crossenterprise applications. ACl enables an automated and compatible business-tobusiness, peer-to-peer infrastructure. The ACl allows enterprise applications to understand and process content that exists in unstructured formats, such as email, Web pages, Microsoft Office documents, and IBM Notes.

## ACI Server

A server component that runs on the Autonomy Content Infrastructure (ACI).

ACL (access control list)
An ACL is metadata associated with a document that defines which users and groups are permitted to access the document.

## action

$A$ request sent to an ACI server.

## active directory

A domain controller for the Microsoft
Windows operating system, which uses
LDAP to authenticate users and computers on a network.

## C

## Category component

The IDOL Server component that manages categorization and clustering.

## chunking

The process of dividing a sentence into a sequence of non-overlapping text regions, or chunks. See also: shallow parsing.

## Community component

The IDOL Server component that manages users and communities.

## compiled grammar

A grammar file that has been compiled from XML into ECR file format using the Eduction command-line tool edktool, so that Eduction can use it directly. See also: XML, ECR file, grammar, standard grammar, user grammar.

## connector

An IDOL component (for example File System Connector) that retrieves information from a local or remote repository (for example, a file system, database, or Web site).

## Connector Framework Server (CFS)

Connector Framework Server processes the information that is retrieved by connectors. Connector Framework Server uses KeyView to extract document content and metadata from over 1,000 different file types. When the information has been processed, it is sent to an IDOL Server or Distributed Index Handler (DIH).

## Content component

The IDOL Server component that manages the data index and performs most of the search and retrieval operations from the index.

## DAH (Distributed Action Handler)

DAH distributes actions to multiple copies of IDOL Server or a component. It allows you to use failover, load balancing, or distributed content.

## database <br> An IDOL server data pool that stores indexed information. The administrator can set up one or more databases, and specifies how data is fed to the databases. By default IDOL server contains the databases Profile, Agent, Activated, Deactivated, News and Archive. <br> dictionary <br> An XML file that provides a vocabulary for an entity. Eduction uses the dictionary to scan a document and extract the defined entities that match the search pattern. See also: XML, entity, extraction.

## DIH (Distributed Index Handler)

DIH allows you to efficiently split and index extremely large quantities of data into multiple copies of IDOL Server or the Content component. DIH allows you to create a scalable solution that delivers high performance and high availability. It provides a flexible way to batch, route, and categorize the indexing of internal and external content into IDOL Server.

## E

## ECR file

ECR is a proprietary format for grammar files that Eduction can easily read at runtime. You can write grammar files in XML, then use the Eduction command-line tool edktool to compile them into ECR format. See also: XML, compiled grammar.

## Eduction

The process of extracting entities (patterns of text) from documents.

## entity

In Eduction, an entity is a word, phrase, or block of information that the Eduction component can match and extract from documents. An entity can be a specific text string, such as a name, or it can be a pattern
of text such as an address or phone number. You define the pattern in a grammar, which Eduction uses to find the entities in documents.

## extraction

Eduction extracts entities from documents based on the rules you have created in your dictionaries and grammars, and returns an XML list of matches, or adds the matches to the source document as new fields. See also: XML, grammar, dictionary.

## F

## field

Fields define different parts of content in IDOL documents, such as the title, content, and metadata information.

## G

## grammar

In Eduction, a grammar is a pattern that defines an entity.

I
IDOL
The Intelligent Data Operating Layer (IDOL) Server, which integrates unstructured, semistructured and structured information from multiple repositories through an understanding of the content. It delivers a real-time environment in which operations across applications and content are automated.

## IDOL Proxy component

An IDOL Server component that accepts incoming actions and distributes them to the appropriate subcomponent. IDOL Proxy also performs some maintenance operations to make sure that the subcomponents are
running, and to start and stop them when necessary.

## IDOL server

The HPE Intelligent Data Operating Layer (IDOL) server, which integrates unstructured, semi-structured and structured information from multiple repositories through an understanding of the content, delivering a real time environment in which operations across applications and content are automated, removing all the manual processes involved in getting the right information to the right people at the right time.

## IDX

A structured file format that can be indexed into IDOL server. You can use a connector to import files into this format or you can manually create IDX files.

## importing

After a document has been downloaded from the repository in which it is stored, it is imported to an IDX or XML file format. This process is called "importing".

## index

The IDOL server data index contains document content and field information for analysis and retrieval.

## indexing

The process of storing data in IDOL server. IDOL server stores data in different field types (such as, index, numeric and ordinary fields). It is important to store data in appropriate field types to ensure optimized performance.

## Intellectual Asset Protection System (IAS)

An integrated security solution to protect your data. At the front end, authentication checks that users are allowed to access the system that contains the result data. At the back end, entitlement checking and authentication combine to ensure that query results contain
only documents that the user is allowed to see, from repositories that the user has permission to access. For more information, refer to the IDOL Document Security Administration Guide.

## K

## KeyView

The IDOL component that extracts data, including text, metadata, and subfiles from over 1,000 different file types. KeyView can also convert documents to HTML format for viewing in a Web browser.

## LDAP

Lightweight Directory Access Protocol.
Applications can use LDAP to retrieve information from a server. LDAP is used for directory services (such as corporate email and telephone directories) and user authentication. See also: active directory, primary domain controller.

## License Server

License Server enables you to license and run multiple IDOL solutions. You must have a License Server on a machine with a known, static IP address.

## Lua

An embedded scripting language that you can use to write custom scripts to expand certain IDOL functionality.

## Luhn algorithm

A formula used to validate identification numbers, such as credit card numbers and social security numbers. The formula checks for errors by performing mathematical operations in the number to calculate a number that must agree with the final digit of the number.

## M

## metadata

Data that describes and gives information about other data. For example, the metadata for a text document might include information about the author of the document, the date it was written, or a short summary.

## 0

## OmniGroupServer (OGS)

A server that manages access permissions for your users. It communicates with your repositories and IDOL Server to apply access permissions to documents.

## P

## parsing

The process of analyzing text according to the rules of a formal grammar.

## pattern

A pattern is a description of the entity you want to extract, that enables Eduction to produce a list of matches based on that pattern. A pattern can explicitly list what Eduction should look for (for example, a list of names), or can specify in general terms what a match should look like (for example, phone numbers). See also: entity, extraction, grammar.

## polarity scoring

A number, usually between 0.50 and 1.50, that represents the strength of the sentiment in the matched phrase.

## precision

Precision is the percentage of extracted entities that are true entities. See also: recall.

## primary domain controller

A server computer in a Microsoft Windows domain that controls various computer resources. See also: active directory, LDAP.

## R

## recall

The recall of an extraction is the percentage of matches that are actually returned, out of the total number of matches that should return in theory. See also: precision.

## regular expressions

A string that allows you to define a particular string pattern in a concise format. In IDOL server, matching in Eduction and Connectors uses regular expressions to define what you want to match.

## relevance

The similarity that a particular query result has to the initial query. IDOL server assigns results a percentage relevance score according to how closely it matches the query criteria.

## sentiment analysis

A form of Eduction that identifies positive and negative sentiment in text.

## shallow parsing

A form of sentence analysis that identifies the constituent parts of the sentence, such as noun phrases, but not their structure or their role in the sentence. See also: chunking.

## standard grammar

Eduction includes a set of standard grammars that allow you to extract the most common entities, such as person, place, or company names, legal terms, addresses,
dates, and times. See also: entity, compiled grammar, grammar, user grammar.

## T

tagging
The process of adding extra information to documents. The tag might be a category, or entities returned from Eduction. Tagging usually adds a field to a document, which you can use to search by the name of a tag.

## tokens

IDOL Server stores document text as a series of tokens. Generally, a token is a word, but it can also include other strings of characters (such as a phone number or email address).

## U

## user grammar

XML files created by the user that describe entities that can locate patterns in text using the Eduction grammar language.

## V

## View

An IDOL component that converts files in a repository to HTML formats for viewing in a Web browser.

## W

## Wildcard

A character that stands in for any character or group of characters in a query.

## XML

Extensible Markup Language. XML is a language that defines the different attributes of document content in a format that can be read by humans and machines. In IDOL Server, you can index documents in XML format. IDOL Server also returns action responses in XML format.

## Send documentation feedback

If you have comments about this document, you can contact the documentation team by email. If an email client is configured on this system, click the link above and an email window opens with the following information in the subject line:

## Feedback on Programming Guide (Eduction SDK 11.4)

Add your feedback to the email and click Send.
If no email client is available, copy the information above to a new message in a web mail client, and send your feedback to AutonomyTPFeedback@hpe.com.

We appreciate your feedback!
