<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItem</a>	Returns the item at the specified index.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item in the combo box.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# AWTComponent Class

## Description

AWTComponent is the base class for Java AWT.

## Inheritance Hierarchy

- [TestObject](#)
  - AWTComponent
    - [AWTButton](#)
    - [AWTCanvas](#)
    - [AWTCheckbox](#)
    - [AWTChoice](#)
    - [AWTContainer](#)
    - [AWTLabel](#)
    - [AWTList](#)
    - [AWTRadioButton](#)
    - [AWTScrollbar](#)
    - [AWTTextComponent](#)

## Syntax

```
'Declaration
Public Class AWTComponent _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable, INativeWindow
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component.
<a href="#">AccessibleRole</a>	The accessible role of the component.
<a href="#">Background</a>	The background color of the component.
<a href="#">Cursor</a>	The name of the cursor set in the component.
<a href="#">Enabled</a>	whether the component is enabled.
<a href="#">Focusable</a>	whether the component can be focused.
<a href="#">Font</a>	The font of the component.
<a href="#">Foreground</a>	The foreground color of the component.
<a href="#">Height</a>	The current height of the component.
<a href="#">Name</a>	The name of the component.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTContainer Class

### Description

Represents a component that can contain other AWT components.

## Inheritance Hierarchy

- [AWTComponent](#)
  - AWTContainer
    - [Applet](#)
    - [AppletContainer](#)
    - [AWTScrollPane](#)
    - [AWTWindow](#)
    - [JComponent](#)
    - [OracleFormsContainer](#)
    - [SplitPaneDivider](#)

## Syntax

```
'Declaration  
Public Class AWTContainer _  
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForPropertyNotEquals</a>	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForScreenshotStable</a>	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>

## AWTDialog Class

### Description

Represents a dialog box.

### Inheritance Hierarchy

- [AWTWindow](#)
  - `AWTDialog`
    - [JDialog](#)

## Syntax

```
'Declaration  
Public Class AWTDialog _  
Inherits AWTWindow
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Modal</a>	whether the dialog is modal.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Resizable</a>	whether the dialog is resizable by the user.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Title</a>	the title of the dialog.
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Size</i></a>	Resizes the window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTFrame Class

### Description

Represents a top-level window with a title and a border.

### Inheritance Hierarchy

- [AWTWindow](#)
  - AWTFrame
    - [JFrame](#)

### Syntax

```
'Declaration
Public Class AWTFrame _
Inherits AWTWindow
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Resizable</a>	whether the frame is resizable by the user.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Title</a>	the title of the frame.
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTHorizontalScrollbar Class

### Description

Represents a horizontal scroll bar.

### Inheritance Hierarchy

- [AWTScrollbar](#)
  - AWTHorizontalScrollbar

### Syntax

```
'Declaration
Public Class AWTHorizontalScrollbar _
Inherits AWTScrollbar
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTLabel Class

### Description

Represents a class for placing text in a container.

### Inheritance Hierarchy

- [AWTComponent](#)
  - AWTLabel

## Syntax

```
'Declaration  
Public Class AWTLabel _  
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Alignment</a>	the alignment of the label.
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTList Class

### Description

Represents a list box.

### Inheritance Hierarchy

- [AWTComponent](#)
  - AWTList

### Syntax

```
'Declaration
Public Class AWTList _
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ItemCount</a>	the number of list items.
<a href="#">Items</a>	a list of items in the list.
<a href="#">MultipleMode</a>	whether the list allows multiple selection.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the currently selected item. -1 (4Test: 0) is returned, if no item is currently selected.
<a href="#">SelectedIndices</a>	the indices of the currently selected items. An empty list is returned, if no items are currently selected.
<a href="#">SelectedItem</a>	the currently selected list item. NULL is returned, if no item is currently selected.
<a href="#">SelectedItems</a>	the currently selected list items. An empty list is returned, if no items are currently selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Deselect</a>	Deselects the specified list item.
<a href="#">DeselectAll</a>	Deselects all list items.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClickItem</a>	Double-clicks a list item.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItem</a>	Returns the list item at the specified index.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item.
<a href="#">SelectAll</a>	Selects all items in the list.
<a href="#">SelectRange</a>	Selects all items within the specified range.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# AWTMenu Class

## Description

Represents a menu component that is accessed from a menu bar.

## Inheritance Hierarchy

- [AWTMenuItem](#)
  - AWTMenu

## Syntax

```
'Declaration  
Public Class AWTMenu _  
Inherits AWTMenuItem
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">Enabled</a>	Whether the menu item is enabled. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects the menu item. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTMenuComponent Class

### Description

Represents the base class of all menu-related controls.

### Inheritance Hierarchy

- [TestObject](#)
  - AWTMenuComponent
    - [AWTMenuItem](#)

### Syntax

```
'Declaration
Public Class AWTMenuComponent _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable
```

### Properties

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTMenuItem Class

### Description

Represents a menu item.

### Inheritance Hierarchy

- [AWTMenuComponent](#)
  - AWTMenuItem
    - [AWTCheckboxMenuItem](#)
    - [AWTMenu](#)

### Syntax

```
'Declaration
Public Class AWTMenuItem _
Inherits AWTMenuComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component.
<a href="#">Enabled</a>	Whether the menu item is enabled.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Selects the menu item.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# AWTRadioButton Class

## Description

Represents a radio button.

## Inheritance Hierarchy

- [AWTComponent](#)
  - AWTRadioButton

## Syntax

```
'Declaration  
Public Class AWTRadioButton _  
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	Whether the radio button is checked.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the radio button.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTScrollbar Class

### Description

Represents a scroll bar. This class includes scroll bars that are parts of controls, such as the scroll bar on a list box.

### Inheritance Hierarchy

- [AWTComponent](#)

- `AWTScrollbar`
  - `AWTHorizontalScrollbar`
  - `AWTVerticalScrollbar`

## Syntax

```
'Declaration
Public Class AWTScrollbar _
Inherits AWTComponent _
Implements IAWTScroller
```

## Properties

Name	Description
<code>AccessibleName</code>	The accessible name of the component. (Inherited from <code>AWTComponent</code> )
<code>AccessibleRole</code>	The accessible role of the component. (Inherited from <code>AWTComponent</code> )
<code>Background</code>	The background color of the component. (Inherited from <code>AWTComponent</code> )
<code>Cursor</code>	The name of the cursor set in the component. (Inherited from <code>AWTComponent</code> )
<code>Enabled</code>	whether the component is enabled. (Inherited from <code>AWTComponent</code> )
<code>Focusable</code>	whether the component can be focused. (Inherited from <code>AWTComponent</code> )
<code>Font</code>	The font of the component. (Inherited from <code>AWTComponent</code> )
<code>Foreground</code>	The foreground color of the component. (Inherited from <code>AWTComponent</code> )
<code>Height</code>	The current height of the component. (Inherited from <code>AWTComponent</code> )
<code>Name</code>	The name of the component. (Inherited from <code>AWTComponent</code> )
<code>NativeHandle</code>	The native window handle for the object. (Inherited from <code>INativeWindow</code> )
<code>PageSize</code>	the block increment value of the scroll bar. (Inherited from <code>IAWTScroller</code> )
<code>Position</code>	the current position of the scroll bar. (Inherited from <code>IAWTScroller</code> )
<code>Range</code>	the range value of the scroll bar. (Inherited from <code>IAWTScroller</code> )
<code>StepSize</code>	the unit increment value of the scroll bar. (Inherited from <code>IAWTScroller</code> )
<code>Text</code>	The text of the control. (Inherited from <code>TestObject</code> )
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code> )
<code>Width</code>	The current width of the component. (Inherited from <code>AWTComponent</code> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTScrollPane Class

### Description

Represents a class that implements automatic horizontal or vertical scrolling for a single child component.

## Inheritance Hierarchy

- [AWTContainer](#)
  - AWTScrollPane

## Syntax

```
'Declaration
Public Class AWTScrollPane _
Inherits AWTContainer _
Implements IAWTScrollable
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	the current scroll position of the scrollable component. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTTextArea Class

### Description

Represents a text area.

### Inheritance Hierarchy

- [AWTTextComponent](#)
  - AWTTextArea

## Syntax

```
'Declaration
Public Class AWTTextArea _
Inherits AWTTextComponent _
Implements IAWTScrollable
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Columns</a>	the number of columns in the text area.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	the current scroll position of the scrollable component. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">Rows</a>	The number of rows in the text area.
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from the text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Insert</a>	Inserts the specified text at the specified position.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReplaceRange</a>	Replaces text between the specified start and end positions with the specified replacement text.
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScrollable</a> )
<a href="#">SelectAll</a>	Selects all the text in the text component. (Inherited from <a href="#">AWTTextComponent</a> )

Name	Description
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SetText</a>	Sets the text of the text component to the specified text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTTextComponent Class

### Description

Represents the base class for the AWTTextField and AWTTextArea classes.

### Inheritance Hierarchy

- [AWTComponent](#)
  - AWTTextComponent
    - [AWTTextArea](#)
    - [AWTTextField](#)

### Syntax

```
'Declaration
Public Class AWTTextComponent _
Inherits AWTComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedText</a>	the current selected text.
<a href="#">SelectionEnd</a>	the end position of the selected text.
<a href="#">SelectionStart</a>	the start position of the selected text.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from the text component.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the text in the text component.
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range.
<a href="#">SetText</a>	Sets the text of the text component to the specified text.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTTextField Class

### Description

Represents single-line and multi-line text field controls whose text can be modified by the user.

### Inheritance Hierarchy

- [AWTTextComponent](#)
  - AWTTextField

### Syntax

```
'Declaration
Public Class AWTTextField _
Inherits AWTTextComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">EchoChar</a>	the character that is displayed instead of the characters that are actually typed.
<a href="#">EchoCharSet</a>	whether <a href="#">EchoChar</a> is set to a value other than 0.
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">IsPassword</a>	whether the text field is a password text field.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selected text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from the text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the text in the text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">SetText</a>	Sets the text of the text component to the specified text. (Inherited from <a href="#">AWTTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTVerticalScrollbar Class

### Description

Represents a vertical scroll bar.

## Inheritance Hierarchy

- [AWTScrollbar](#)
  - AWTVerticalScrollbar

## Syntax

```
'Declaration  
Public Class AWTVerticalScrollbar _  
Inherits AWTScrollbar
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>Page</i></a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#"><i>IAWTScroller</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>ScrollTo</i></a>	Scrolls to the specified position. (Inherited from <a href="#"><i>IAWTScroller</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Step</i></a>	Increments the current scroll position by specified steps. (Inherited from <a href="#"><i>IAWTScroller</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTWindow Class

### Description

Represents a top-level window with no borders and no menubar.

## Inheritance Hierarchy

- [AWTContainer](#)
  - AWTWindow
    - [AWTDialog](#)
    - [AWTFrame](#)
    - [JWindow](#)

## Syntax

```
'Declaration  
Public Class AWTWindow _  
Inherits AWTContainer _  
Implements IMoveable
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## BasicArrowButton Class

### Description

Represents a push button with an arrow in one of the cardinal directions.

### Inheritance Hierarchy

- [JButton](#)
  - BasicArrowButton

### Syntax

```
'Declaration
Public Class BasicArrowButton _
Inherits JButton
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Direction</a>	the direction the arrow points to.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## IAWTScrollable Interface

### Description

Represents an interface for AWT objects that can have two scroll bars.

### Inheritance Hierarchy

- [IBaseScrollable](#)
  - IAWTScrollable

### Syntax

```
'Declaration
Public Class IAWTScrollable _
Inherits IBaseScrollable
```

### Properties

Name	Description
<a href="#">Position</a>	the current scroll position of the scrollable component. (Inherited from <a href="#">IBaseScrollable</a> )

### Methods

Name	Description
<a href="#">GetHorizontalBar</a>	Gets the horizontal scroll bar.
<a href="#">GetVerticalBar</a>	Gets the vertical scroll bar.
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IBaseScrollable</a> )

## IAWTScroller Interface

### Description

Represents an interface for scrollable AWT objects.

### Syntax

```
'Declaration
Public Class IAWTScroller
```

## Properties

Name	Description
<i>PageSize</i>	the block increment value of the scroll bar.
<i>Position</i>	the current position of the scroll bar.
<i>Range</i>	the range value of the scroll bar.
<i>StepSize</i>	the unit increment value of the scroll bar.

## Methods

Name	Description
<i>Page</i>	Increments the current scroll position by specified number of pages.
<i>ScrollTo</i>	Scrolls to the specified position.
<i>Step</i>	Increments the current scroll position by specified steps.

# IBaseScrollable Interface

## Description

Represents an interface for other scrollable controls to avoid duplication.

## Syntax

```
'Declaration  
Public Class IBaseScrollable
```

## Properties

Name	Description
<i>Position</i>	the current scroll position of the scrollable component.

## Methods

Name	Description
<i>ScrollTo</i>	Scrolls to the specified position.

# IOracleFormsMenuBase Interface

## Description

Represents a control that defines choices for users to select.

## Syntax

```
'Declaration  
Public Class IOracleFormsMenuBase
```

## Properties

Name	Description
<a href="#">Checked</a>	Whether the MenuItem is checked.

# IOracleFormsScrollable Interface

## Description

Represents an interface for scrollable oracle forms objects.

## Syntax

```
'Declaration  
Public Class IOracleFormsScrollable
```

## Properties

Name	Description
<a href="#">HorizontalScrollbarPageSize</a>	the block increment value of the scroll bar.
<a href="#">HorizontalScrollbarPosition</a>	the current position of the scroll bar.
<a href="#">HorizontalScrollbarRange</a>	the range value of the scroll bar.
<a href="#">HorizontalScrollbarStepSize</a>	the unit increment value of the scroll bar.
<a href="#">VerticalScrollbarPageSize</a>	the block increment value of the scroll bar.
<a href="#">VerticalScrollbarPosition</a>	the current position of the scroll bar.
<a href="#">VerticalScrollbarRange</a>	the range value of the scroll bar.
<a href="#">VerticalScrollbarStepSize</a>	the unit increment value of the scroll bar.

## Methods

Name	Description
<a href="#">GetHorizontalScrollbar</a>	Gets the horizontal scroll bar.
<a href="#">GetVerticalScrollbar</a>	Gets the vertical scroll bar.
<a href="#">HorizontalScrollbarPage</a>	Increments the current scroll position by specified number of pages.
<a href="#">HorizontalScrollbarScrollTo</a>	Scrolls to the specified position.
<a href="#">HorizontalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller.
<a href="#">HorizontalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller.
<a href="#">HorizontalScrollbarStep</a>	Increments the current scroll position by specified steps.
<a href="#">VerticalScrollbarPage</a>	Increments the current scroll position by specified number of pages.
<a href="#">VerticalScrollbarScrollTo</a>	Scrolls to the specified position.
<a href="#">VerticalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller.
<a href="#">VerticalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller.
<a href="#">VerticalScrollbarStep</a>	Increments the current scroll position by specified steps.

# IOracleFormsScroller Interface

## Description

Represents an interface for scrollable oracle forms objects.

## Inheritance Hierarchy

- [IAWTScroller](#)
  - IOracleFormsScroller

## Syntax

```
'Declaration  
Public Class IOracleFormsScroller _  
Inherits IAWTScroller
```

## Properties

Name	Description
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )

## Methods

Name	Description
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">ScrollToMax</a>	Scrolls to the maximum position of the scroller.
<a href="#">ScrollToMin</a>	Scrolls to the minimum position of the scroller.
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IAWTScroller</a> )

# JButton Class

## Description

Represents a push button.

## Inheritance Hierarchy

- [AbstractButton](#)
  - JButton

- [BasicArrowButton](#)

## Syntax

```
'Declaration
Public Class JButton _
Inherits AbstractButton
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<a href="#"><i>WaitForObject</i></a>	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## JCheckBox Class

### Description

Represents a check box.

### Inheritance Hierarchy

- [\*JToggleButton\*](#)
  - JCheckBox

### Syntax

```
'Declaration
Public Class JCheckBox _
Inherits JToggleButton
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Selected</a>	whether the toggle button is selected. (Inherited from <a href="#">JToggleButton</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>DoubleClick</i></a>	Double-clicks a mouse button on the object. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Toggles the button. (Inherited from <a href="#">JToggleButton</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<a href="#">WaitForObject</a>	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JCheckBoxMenuItem Class

### Description

Represents a check box control that can be included in a menu item.

### Inheritance Hierarchy

- [JMenuItem](#)
  - JCheckBoxMenuItem

### Syntax

```
'Declaration
Public Class JCheckBoxMenuItem _
Inherits JMenuItem
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	whether the check box in a menu item is checked.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i> )
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )

## JColorChooser Class

### Description

Represents a color chooser.

### Inheritance Hierarchy

- *JComponent*
  - JColorChooser

### Syntax

```
'Declaration
Public Class JColorChooser _
Inherits JComponent
```

### Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i> )
<i>AccessibleRole</i>	The accessible role of the component. (Inherited from <i>AWTComponent</i> )

Name	Description
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Color</a>	the current color value from the color chooser.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. <a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JComboBox Class

### Description

Represents a combo box.

### Inheritance Hierarchy

- [JComponent](#)
  - JComboBox

### Syntax

```
'Declaration
Public Class JComboBox _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Editable</a>	whether the combo box is editable.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ItemCount</a>	the number of items in the list.
<a href="#">Items</a>	the list of all contained items.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the currently selected item.
<a href="#">SelectedItem</a>	the current selected item.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetItem</i>	Returns the item at the specified index.
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JComponent Class

### Description

Represents a class for all components except top-level containers.

### Inheritance Hierarchy

<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JDIALOG Class

### Description

Represents a dialog box.

### Inheritance Hierarchy

- [AWTDialog](#)
  - JDIALOG

### Syntax

```
'Declaration
Public Class JDIALOG _
Inherits AWTDialog
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Modal</a>	whether the dialog is modal. (Inherited from <a href="#">AWTDialog</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Resizable</a>	whether the dialog is resizable by the user. (Inherited from <a href="#">AWTDialog</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Title</a>	the title of the dialog. (Inherited from <a href="#">AWTDialog</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JEditorPane Class

### Description

Represents a text component where you can edit different types of content.

### Inheritance Hierarchy

- [JTextComponent](#)
  - JEditorPane
    - [JTextPane](#)

### Syntax

```
'Declaration
Public Class JEditorPane _
Inherits JTextComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">ContentType</a>	the type of content that this editor is currently set to deal with.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">FormattedText</a>	the text of the editor pane.

Name	Description
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Page</a>	the current URL being displayed.
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetText</a>	Sets the text content to the specified text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JFrame Class

### Description

Represents a class for an extended version of `AWTFrame` that adds support for Java Swing.

### Inheritance Hierarchy

- [AWTFrame](#)
  - JFrame

### Syntax

```
'Declaration
Public Class JFrame _
Inherits AWTFrame
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Resizable</a>	whether the frame is resizable by the user. (Inherited from <a href="#">AWTFrame</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Title</a>	the title of the frame. (Inherited from <a href="#">AWTFrame</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsActive</i></a>	Returns whether the window is set to active. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>Maximize</i></a>	Maximizes the window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>Minimize</i></a>	Reduces the window to an icon. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Restore</i></a>	Restores the window to its previous size. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetActive</i></a>	Makes the window active. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Size</i></a>	Resizes the window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# JHorizontalScrollBar Class

## Description

Represents a horizontal scroll bar.

## Inheritance Hierarchy

- [JScrollBar](#)
  - JHorizontalScrollBar

## Syntax

```
'Declaration  
Public Class JHorizontalScrollBar _  
Inherits JScrollBar
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>Page</i></a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#"><i>IAWTScroller</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>ScrollTo</i></a>	Scrolls to the specified position. (Inherited from <a href="#"><i>IAWTScroller</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> Step </a>	Increments the current scroll position by specified steps. (Inherited from <a href="#"> IAWTScroller </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JLabel Class

### Description

Represents a display area for displaying a short text, image, or both.

### Inheritance Hierarchy

- [JComponent](#)
  - JLabel

### Syntax

```
'Declaration
Public Class JLabel _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Alignment</a>	the alignment of the label.
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JLayeredPane Class

### Description

Represents a layered pane.

### Inheritance Hierarchy

- [JComponent](#)
  - JLayeredPane
    - [JDesktopPane](#)

### Syntax

```
'Declaration
Public Class JLayeredPane _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# JList Class

## Description

Represents a list box.

## Inheritance Hierarchy

- [JComponent](#)
  - JList

## Syntax

```
'Declaration  
Public Class JList _  
Inherits JComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ItemCount</a>	the number of list items.
<a href="#">Items</a>	the list of all contained list items.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the selected list item.
<a href="#">SelectedIndices</a>	the list of indices of the selected list items.
<a href="#">SelectedItem</a>	the name or index of the selected list item.
<a href="#">SelectedItems</a>	the list of names or indices of the selected list items.

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ClickItem</a>	Clicks the specified list item.
<a href="#">Deselect</a>	Deselects the specified list item.
<a href="#">DeselectAll</a>	Deselects all list items.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClickItem</a>	Double-clicks a list item.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindItem</a>	Returns the index of an item in the list.
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItem</a>	Returns the item at the specified index.
<a href="#">GetItemRect</a>	Returns the size and position of the item relative to the list.
<a href="#">GetItemValue</a>	Returns the value object of the list item.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollItemIntoView</a>	Scrolls an item into view.
<a href="#">Select</a>	Selects a list item.
<a href="#">SelectAll</a>	Selects all list elements.
<a href="#">SelectRange</a>	Selects a specified range of list elements.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JMenu Class

### Description

Represents a menu. A menu is a menu item that has child items.

### Inheritance Hierarchy

- [JMenuItem](#)
  - JMenu

### Syntax

```
'Declaration
Public Class JMenu _
Inherits JMenuItem
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JMenuBar Class

### Description

Represents a menu bar.

### Inheritance Hierarchy

- [JComponent](#)
  - JMenuBar

### Syntax

```
'Declaration
Public Class JMenuBar _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. <a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# JPasswordField Class

## Description

Represents a single-line field that does not show the original characters.

## Inheritance Hierarchy

- [JTextField](#)
  - JPasswordField

## Syntax

```
'Declaration  
Public Class JPasswordField _  
Inherits JTextField
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Alignment</a>	the alignment of the text field. (Inherited from <a href="#">JTextField</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">EchoChar</a>	the character that is displayed instead of the characters that are actually typed.
<a href="#">EchoCharSet</a>	whether <a href="#">EchoChar</a> is set to a value other than 0.
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetText</a>	Sets the text content to the specified text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JPopupMenu Class

### Description

Represents a context menu.

### Inheritance Hierarchy

- [JComponent](#)
  - JPopupMenu

### Syntax

```
'Declaration
Public Class JPopupMenu _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JProgressBar Class

### Description

Displays the progress of an operation.

### Inheritance Hierarchy

- [JComponent](#)
  - JProgressBar

### Syntax

```
'Declaration
Public Class JProgressBar _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Indeterminate</a>	whether the progress bar is indeterminate.
<a href="#">Maximum</a>	the progress bar's maximum value.
<a href="#">Minimum</a>	the progress bar's minimum value.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">ProgressString</a>	the string representation of the current progress.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JRadioButton Class

### Description

Represents a radio button.

### Inheritance Hierarchy

<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JRootPane Class

### Description

Represents a root pane.

### Inheritance Hierarchy

- [JComponent](#)
  - JRootPane

### Syntax

```
'Declaration
Public Class JRootPane _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# JScrollBar Class

## Description

Represents a scroll bar.

## Inheritance Hierarchy

- [JComponent](#)
  - JScrollBar
    - [JHorizontalScrollBar](#)
    - [JVerticalScrollBar](#)

## Syntax

```
'Declaration  
Public Class JScrollBar _  
Inherits JComponent _  
Implements IAWTScroller
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )

Name	Description
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScroller</a> )

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
<a href="#">WaitForScreenshotStable</a>	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JScrollPane Class

### Description

Represents a scroll pane which allows scrolling its content which may be larger than the pane itself.

### Inheritance Hierarchy

- [JComponent](#)
  - JScrollPane

### Syntax

```
'Declaration
Public Class JScrollPane _
Inherits JComponent _
Implements IBaseScrollable
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	the current scroll position of the scrollable component. (Inherited from <a href="#">IBaseScrollable</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetHorizontalBar</a>	Gets the horizontal scroll bar.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Gets the vertical scroll bar.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IBaseScrollable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JSlider Class

### Description

Represents a slider control which can select a value within a range.

### Inheritance Hierarchy

- [JComponent](#)
  - JSlider

### Syntax

```
'Declaration
Public Class JSlider _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Inverted</a>	the value is <i>true</i> if the value-range shown for the slider is reversed.
<a href="#">Maximum</a>	the maximum value supported by the slider.
<a href="#">Minimum</a>	the minimum value supported by the slider.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	the position of the slider.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetPosition</a>	Sets the current position of the slider.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JSpinner Class

### Description

Represents a spinner control which can iterate a sequence of values.

### Inheritance Hierarchy

- [JComponent](#)
  - JSpinner

### Syntax

```
'Declaration
Public Class JSpinner _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Next</i></a>	Sets the spinner to the object in the sequence that comes after the object returned by the Value property.
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Previous</i></a>	Sets the spinner to the object in the sequence that comes before the object returned by the Value property.
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JSplitPane Class

### Description

Represents a split pane control which divides two components horizontally or vertically.

### Inheritance Hierarchy

- [JComponent](#)
  - JSplitPane

### Syntax

```
'Declaration
Public Class JSplitPane _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">DividerLocation</a>	the current divider location.
<a href="#">DividerSize</a>	the size of the divider.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">MaximumDividerLocation</a>	the maximum location of the divider.

Name	Description
<i>MinimumDividerLocation</i>	the minimum location of the divider.
<i>Name</i>	The name of the component. (Inherited from <i>AWTComponent</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>ToolTipText</i>	the tool tip text of a Swing component. (Inherited from <i>JComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	The current width of the component. (Inherited from <i>AWTComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#">SetPosition</a>	Sets the position of the divider.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JTabbedPane Class

### Description

Represents a tabbed pane.

### Inheritance Hierarchy

- [JComponent](#)
  - JTabbedPane

### Syntax

```
'Declaration
Public Class JTabbedPane _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )

Name	Description
<a href="#">SelectedTab</a>	the currently selected tab.
<a href="#">SelectedTabIndex</a>	the index of the currently selected tab or -1 (4Test: 0) if no tab is selected.
<a href="#">TabCount</a>	the number of tabs.
<a href="#">TabRunCount</a>	the number of tab runs currently used to display the tabs.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetTabIndex</a>	Returns the tab index.
<a href="#">GetTabTitle</a>	Returns the tab title.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsTabEnabled</a>	Returns whether or not the tab is currently enabled.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JTable Class

### Description

Represents a table control which has rows and columns.

### Inheritance Hierarchy

- [JComponent](#)
  - JTable

### Syntax

```
'Declaration
Public Class JTable _
Inherits JComponent
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AllCellTexts</a>	the text values of all cells in the table. The cells are grouped in rows, where each row contains the texts of its cells.
<a href="#">AllCellValues</a>	the values of all cells in the table. The cells are grouped in rows, where each row contains the values of its cells.
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ColumnCount</a>	the number of columns in the table.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">EditingColumn</a>	the name or index of the column that contains the cell currently being edited.
<a href="#">EditingRow</a>	the index of the row that contains the cell currently being edited.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">RowCount</a>	the number of rows that can be shown in the table.
<a href="#">SelectedColumn</a>	the index or name of the selected column. -1 (4Test: 0) is returned if no column is selected.
<a href="#">SelectedColumns</a>	the list of indices of all selected columns.
<a href="#">SelectedRow</a>	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
<a href="#">SelectedRows</a>	the list of indices of all selected rows.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearSelection</a>	Deselects all selected columns and rows.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ClickCell</a>	Clicks the specified cell in the table.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClickCell</a>	Double-clicks the specified cell in the table.

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindCell</a>	Returns the cell containing the specified text.
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCellText</a>	Returns the cell text.
<a href="#">GetCellValue</a>	Returns the cell value.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetColumnName</a>	Returns the name of the column at the specified index.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsCellEditable</a>	Returns true if the specified cell is editable.
<a href="#">IsCellSelected</a>	Returns true if the specified cell is selected; otherwise false.
<a href="#">IsColumnSelected</a>	Returns true if the specified column is selected.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsRowSelected</a>	Returns true if the specified row is selected.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MoveColumn</a>	Moves the column to the position of the target column.
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ResizeColumn</a>	Resizes the specified column.
<a href="#">ScrollCellIntoView</a>	Scrolls the specified cell into view.
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all rows, columns, and cells in the table.
<a href="#">SelectColumn</a>	Selects the specified column.
<a href="#">SelectRow</a>	Selects the specified row.
<a href="#">SetCellValue</a>	Sets the specified value for the specified cell in the table.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# JTableHeader Class

## Description

Represents table header class for the table component.

## Inheritance Hierarchy

- [JComponent](#)
  - JTableHeader

## Syntax

```
'Declaration  
Public Class JTableHeader _  
Inherits JComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ClickColumnHeader</a>	Clicks the column header of the table.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JTextArea Class

### Description

Represents a multiple-line area control that displays plain text.

### Inheritance Hierarchy

- [JTextComponent](#)
  - JTextArea

## Syntax

```
'Declaration  
Public Class JTextArea _  
Inherits JTextComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Columns</a>	the number of columns in the text area.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Rows</a>	The number of rows in the text area.
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Insert</a>	Inserts the specified text at the specified position.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReplaceRange</a>	Replaces text within the specified range with the new text specified.
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetText</a>	Sets the text content to the specified text. (Inherited from <a href="#">JTextComponent</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JTextComponent Class

### Description

Represents a text control that can be marked with attributes that are represented graphically.

### Inheritance Hierarchy

- [JComponent](#)

```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedText</a>	the current selected text.
<a href="#">SelectionEnd</a>	the end position of the selection.
<a href="#">SelectionStart</a>	the start position of the selection.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component.
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range.
<a href="#">SetText</a>	Sets the text content to the specified text.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#"><i>WaitForPropertyNotEquals</i></a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## JTextField Class

### Description

Represents a single-line text field control whose text can be modified by the user.

### Inheritance Hierarchy

- [\*JTextComponent\*](#)
  - JTextField
  - [\*JPasswordField\*](#)

### Syntax

```
'Declaration
Public Class JTextField _
Inherits JTextComponent
```

### Properties

Name	Description
<a href="#"><i>AccessibleName</i></a>	The accessible name of the component. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>AccessibleRole</i></a>	The accessible role of the component. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>Alignment</i></a>	the alignment of the text field.
<a href="#"><i>Background</i></a>	The background color of the component. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>CaretPosition</i></a>	the position of the text insertion caret for the text component. (Inherited from <a href="#"><i>JTextComponent</i></a> )
<a href="#"><i>Cursor</i></a>	The name of the cursor set in the component. (Inherited from <a href="#"><i>AWTComponent</i></a> )

Name	Description
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetText</a>	Sets the text content to the specified text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JTextPane Class

### Description

Represents a text pane control that can be marked with attributes that are represented graphically.

### Inheritance Hierarchy

- [JEditorPane](#)
  - JTextPane

### Syntax

```
'Declaration
Public Class JTextPane _
Inherits JEditorPane
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">CharacterAttributes</a>	the character attributes in effect at the location of the caret.
<a href="#">ContentType</a>	the type of content that this editor is currently set to deal with. (Inherited from <a href="#">JEditorPane</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text component can be changed by the user. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">FormattedText</a>	the text of the editor pane. (Inherited from <a href="#">JEditorPane</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">LogicalStyle</a>	the logical style assigned to the current paragraph in effect at the location of the caret.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Page</a>	the current URL being displayed. (Inherited from <a href="#">JEditorPane</a> )
<a href="#">ParagraphAttributes</a>	the attributes of the current paragraph in effect at the location of the caret.
<a href="#">SelectedText</a>	the current selected text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionEnd</a>	the end position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SelectionStart</a>	the start position of the selection. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the content in the text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text component. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">SetSelectionRange</a>	Selects the text within the specified range. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">SetText</a>	Sets the text content to the specified text. (Inherited from <a href="#">JTextComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JToggleButton Class

### Description

Represents a two-state button.

### Inheritance Hierarchy

- [AbstractButton](#)
  - JToggleButton
    - [JCheckBox](#)
    - [JRadioButton](#)

### Syntax

```
'Declaration
Public Class JToggleButton _
Inherits AbstractButton
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Selected</a>	whether the toggle button is selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button. (Inherited from <a href="#">AbstractButton</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Toggles the button.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JToolBar Class

### Description

Represents a toolbar.

### Inheritance Hierarchy

- [JComponent](#)

<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# JTree Class

## Description

Represents a tree.

## Inheritance Hierarchy

- [JComponent](#)
  - JTree

## Syntax

```
'Declaration  
Public Class JTree _  
Inherits JComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">IsEditable</a>	whether the tree is editable.
<a href="#">IsEditing</a>	whether the tree is being edited.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedItemPath</a>	the selected item path.
<a href="#">SelectedItemPaths</a>	the list of selected item paths.
<a href="#">SelectedItemText</a>	the selected item text.
<a href="#">SelectionCount</a>	the number of tree nodes selected.

Name	Description
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>ToolTipText</i>	the tool tip text of a Swing component. (Inherited from <i>JComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>VisibleItemPaths</i>	the visible items in the tree as item paths.
<i>Width</i>	The current width of the component. (Inherited from <i>AWTComponent</i> )

## Methods

Name	Description
<i>CancelEditing</i>	Cancels the current editing session.
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ClearSelection</i>	Clears the selection.
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>ClickNode</i>	Clicks on a tree node specified by the item path.
<i>Collapse</i>	Collapses the tree node identified by the specified item path.
<i>CollapseAll</i>	Collapses all tree nodes.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClickNode</i>	Double-clicks on a tree node specified by the item path.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Expand</i>	Expands the tree node identified by the specified item path.
<i>ExpandAll</i>	Expands all tree nodes.
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItemRect</a>	Returns the size and position of the item relative to the tree.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsExpanded</a>	Returns 'true' if the specified item path is expanded.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsPathEditable</a>	whether an item path is editable.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollPathIntoView</a>	Scrolls the given item path to a visible position.
<a href="#">Select</a>	Selects a tree node identified by the specified item path.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">StartEditing</a>	Starts editing at given item path or current selection.
<a href="#">StopEditing</a>	Stops the current editing session.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
<a href="#">WaitForObject</a>	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JVerticalScrollBar Class

### Description

Represents a vertical scroll bar.

### Inheritance Hierarchy

- [JScrollBar](#)
  - JVerticalScrollBar

### Syntax

```
'Declaration
Public Class JVerticalScrollBar _
Inherits JScrollBar
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IAWTScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	<p>OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p> <p>Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. <a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## JWindow Class

### Description

Represents a container that can be displayed anywhere on the user's desktop.

### Inheritance Hierarchy

- [AWTWindow](#)
  - JWindow

### Syntax

```
'Declaration
Public Class JWindow _
Inherits AWTWindow
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsApplication Class

### Description

Represents an Oracle Forms application.

## Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsApplication

## Syntax

```
'Declaration
Public Class OracleFormsApplication _
Inherits OracleFormsContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SplashScreenRunning</a>	whether the application currently displays a splash screen.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsCheckbox Class

### Description

Represents a check box.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsCheckbox

### Syntax

```
'Declaration
Public Class OracleFormsCheckbox _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	whether the check box is checked.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. <a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItemText</a>	Returns the item at the specified index. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item in the choice. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetText</a>	Sets the text of the combo box to the specified text.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## OracleFormsContainer Class

### Description

Represents a component that can contain other Oracle Forms components.

### Inheritance Hierarchy

- [\*AWTContainer\*](#)
  - OracleFormsContainer
    - [\*OracleFormsApplication\*](#)
    - [\*OracleFormsButton\*](#)
    - [\*OracleFormsCheckbox\*](#)
    - [\*OracleFormsChoice\*](#)
    - [\*OracleFormsLabel\*](#)

- [OracleFormsListView](#)
- [OracleFormsMenu](#)
- [OracleFormsMenuItem](#)
- [OracleFormsRadioButton](#)
- [OracleFormsScrollbar](#)
- [OracleFormsStatusArea](#)
- [OracleFormsStatusBar](#)
- [OracleFormsStatusBarItem](#)
- [OracleFormsStatusIndicator](#)
- [OracleFormsTabBar](#)
- [OracleFormsTabBarItem](#)
- [OracleFormsTabPanel](#)
- [OracleFormsTextField](#)
- [OracleFormsTitleBar](#)
- [OracleFormsToolBar](#)
- [OracleFormsToolBarItem](#)
- [OracleFormsTree](#)

## Syntax

```
'Declaration
Public Class OracleFormsContainer _
Inherits AWTContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# OracleFormsHorizontalScrollbar Class

## Description

Represents a horizontal scroll bar.

## Inheritance Hierarchy

- [OracleFormsScrollbar](#)
  - OracleFormsHorizontalScrollbar

## Syntax

```
'Declaration  
Public Class OracleFormsHorizontalScrollbar _  
Inherits OracleFormsScrollbar
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )

Name	Description
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">ScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScroller</a> )

Name	Description
<a href="#">ScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsLabel Class

### Description

Represents a class for placing text in a container.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsLabel

### Syntax

```
'Declaration
Public Class OracleFormsLabel _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsListBox Class

### Description

Represents a ListBox.

### Inheritance Hierarchy

- [OracleFormsChoice](#)
  - OracleFormsListBox

### Syntax

```
'Declaration
Public Class OracleFormsListBox _
Inherits OracleFormsChoice _
Implements IOracleFormsScrollable
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">HorizontalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )

Name	Description
<a href="#">HorizontalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">ItemCount</a>	the number of items in the choice. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Items</a>	the list of choice items. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">SelectedItem</a>	the selected item. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ClickItem</a>	Clicks the specified list item.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClickItem</a>	Double-clicks a list item.

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalScrollbar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">GetItemText</a>	Returns the item at the specified index. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalScrollbar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HorizontalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item in the choice. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">VerticalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsListView Class

### Description

Represents a listview.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsListView

### Syntax

```
'Declaration
Public Class OracleFormsListView _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AllCellTexts</a>	the text values of all cells in the listview. The cells are grouped in rows, where each row contains the texts of its cells.
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ColumnCount</a>	the number of columns in the listview.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">FocusedRow</a>	the index of the focused row, -1 (4Test: 0) is returned if no row is focused.
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">HorizontalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">RowCount</a>	the number of rows in the listview.
<a href="#">SelectedRow</a>	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearSelection</a>	Clears the selection.

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCellText</a>	Returns the cell text.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetColumnName</a>	Returns the name of the column at the specified index.
<a href="#">GetColumnWidth</a>	Returns the width of the specified column.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalScrollbar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalScrollbar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HorizontalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )

Name	Description
<a href="#">HorizontalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsRowVisible</a>	Returns whether the specified row is visible.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollToRow</a>	Scrolls to the specified row.
<a href="#">SelectRow</a>	Selects the specified row.
<a href="#">SetColumnWidth</a>	Sets the width of the specified column.

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">VerticalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsMenu Class

### Description

Represents a top-level menu.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsMenu
    - [OracleFormsPopupMenu](#)

### Syntax

```
'Declaration
Public Class OracleFormsMenu _
Inherits OracleFormsContainer _
Implements IOracleFormsMenuBase
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	Whether the MenuItem is checked. (Inherited from <a href="#">IOracleFormsMenuBase</a> )

Name	Description
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks a menu item
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsChecked</a>	a value that indicates whether the MenuItem is checked.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects a menu item
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks a menu item
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsMenuItem Class

### Description

Represents a selectable item inside a Menu.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsMenuItem

### Syntax

```
'Declaration
Public Class OracleFormsMenuItem _
Inherits OracleFormsContainer _
Implements IOracleFormsMenuBase
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	Whether the MenuItem is checked. (Inherited from <a href="#">IOracleFormsMenuBase</a> )

Name	Description
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks a menu item
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects a menu item
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks a menu item
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsPopList Class

### Description

Represents a PopList.

### Inheritance Hierarchy

- [OracleFormsChoice](#)
  - OracleFormsPopList

### Syntax

```
'Declaration
Public Class OracleFormsPopList _
Inherits OracleFormsChoice
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">DropDownOpen</a>	whether the drop down is currently open.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ItemCount</a>	the number of items in the choice. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Items</a>	the list of choice items. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">SelectedItem</a>	the selected item. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetItemText</i>	Returns the item at the specified index. (Inherited from <i>OracleFormsChoice</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the specified item in the choice. (Inherited from <a href="#">OracleFormsChoice</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsPopupMenu Class

### Description

Represents a context menu.

### Inheritance Hierarchy

- [OracleFormsMenu](#)
  - OracleFormsPopupMenu

### Syntax

```
'Declaration
Public Class OracleFormsPopupMenu _

<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsScrollbar Class

### Description

Represents a scroll bar.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsScrollbar
    - [OracleFormsHorizontalScrollbar](#)
    - [OracleFormsVerticalScrollbar](#)

### Syntax

```
'Declaration
Public Class OracleFormsScrollbar _
Inherits OracleFormsContainer _
Implements IOracleFormsScroller
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Page</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">ScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">ScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Step</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsStatusArea Class

### Description

Represents the area containing status information.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsStatusArea

## Syntax

```
'Declaration  
Public Class OracleFormsStatusArea _  
Inherits OracleFormsContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )

	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsStatusBarItem Class

### Description

Represents an item within a status bar.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsStatusBarItem

### Syntax

```
'Declaration
Public Class OracleFormsStatusBarItem _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsStatusIndicator Class

### Description

Represents a status indicator.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsStatusIndicator

### Syntax

```
'Declaration
Public Class OracleFormsStatusIndicator _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<i>Font</i>	The font of the component. (Inherited from <i>AWTComponent</i> )
<i>Foreground</i>	The foreground color of the component. (Inherited from <i>AWTComponent</i> )
<i>Height</i>	The current height of the component. (Inherited from <i>AWTComponent</i> )
<i>Name</i>	The name of the component. (Inherited from <i>AWTComponent</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	The current width of the component. (Inherited from <i>AWTComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
<a href="#">WaitForScreenshotStable</a>	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsTabBar Class

### Description

Represents a tab bar.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsTabBar

### Syntax

```
'Declaration
Public Class OracleFormsTabBar _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedTab</a>	the currently selected tab.
<a href="#">TabCount</a>	the number of tabs.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetTabIndex</i></a>	Returns the tab index.
<a href="#"><i>GetTabTitle</i></a>	Returns the tab title.
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>IsTabEnabled</i></a>	Returns whether or not the tab is currently enabled.
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )

Name	Description
<a href="#">Select</a>	Selects the specified tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
<a href="#">WaitForScreenshotStable</a>	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsTabBarItem Class

### Description

Represents a tab bar item.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsTabBarItem

### Syntax

```
'Declaration
Public Class OracleFormsTabBarItem _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsTabPanel Class

### Description

Represents a container class for components.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsTabPanel

### Syntax

```
'Declaration
Public Class OracleFormsTabPanel _
Inherits OracleFormsContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsTextField Class

### Description

Represents an Oracle Forms text field.

## Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsTextField

## Syntax

```
'Declaration
Public Class OracleFormsTextField _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">CaretPosition</a>	the position of the text insertion caret for the text field.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Editable</a>	whether the text of the text field can be changed by the user.
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">HorizontalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">IsPassword</a>	whether the text field is a password text field.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )

Name	Description
<a href="#">PasswordChar</a>	the character that is displayed instead of the characters that are actually typed, if the text field is a password text field.
<a href="#">SelectedText</a>	the current selected text.
<a href="#">SelectionEnd</a>	the end position of the selected text.
<a href="#">SelectionStart</a>	the start position of the selected text.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all the text from the text field.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalScrollbar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalScrollbar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HorizontalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SelectAll</a>	Selects all the text in the text field.
<a href="#">SetCaretPosition</a>	Sets the position of the text insertion caret for this text field.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the text within the specified range.
<a href="#">SetText</a>	Sets the text of the text field to the specified text.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">VerticalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )

Name	Description
<a href="#">VerticalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# OracleFormsTitleBar Class

## Description

Represents a title bar.

## Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsTitleBar

## Syntax

```
'Declaration  
Public Class OracleFormsTitleBar _  
Inherits OracleFormsContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. <a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsToolBarItem Class

### Description

Represents an element in a toolbar.

### Inheritance Hierarchy

- [OracleFormsContainer](#)
  - OracleFormsToolBarItem

### Syntax

```
'Declaration
Public Class OracleFormsToolBarItem _
Inherits OracleFormsContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the element.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i> )
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )

## OracleFormsTree Class

### Description

Represents a tree.

### Inheritance Hierarchy

- *OracleFormsContainer*
  - OracleFormsTree

### Syntax

```
'Declaration
Public Class OracleFormsTree _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

### Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i> )

Name	Description
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">HorizontalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedItemPath</a>	the list of selected item path.
<a href="#">SelectedItemText</a>	the selected item text.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticalScrollbarPageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarPosition</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarRange</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ClickItem</a>	Clicks on a tree node specified by the item path.
<a href="#">Collapse</a>	Collapses the tree node identified by the specified item path.
<a href="#">CollapseAll</a>	Collapses all tree nodes.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClickItem</a>	Double-clicks on a tree node specified by the item path.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands the tree node identified by the specified item path.
<a href="#">ExpandAll</a>	Expands all tree nodes.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalScrollbar</a>	Gets the horizontal scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalScrollbar</a>	Gets the vertical scroll bar. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HorizontalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">HorizontalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsExpanded</a>	Returns 'true' if the specified item path is expanded.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsVisible</a>	Returns 'true' if the specified item path is visible.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ScrollItemIntoView</a>	Scrolls the given item path to a visible position.
<a href="#">Select</a>	Selects a tree node identified by the specified item path.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">VerticalScrollbarPage</a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollTo</a>	Scrolls to the specified position. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMax</a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarScrollToMin</a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">VerticalScrollbarStep</a>	Increments the current scroll position by specified steps. (Inherited from <a href="#">IOracleFormsScrollable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## OracleFormsVerticalScrollbar Class

### Description

Represents a vertical scroll bar.

### Inheritance Hierarchy

- [OracleFormsScrollbar](#)
  - OracleFormsVerticalScrollbar

```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	the block increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Position</a>	the current position of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Range</a>	the range value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">StepSize</a>	the unit increment value of the scroll bar. (Inherited from <a href="#">IOracleFormsScroller</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>Page</i></a>	Increments the current scroll position by specified number of pages. (Inherited from <a href="#"><i>IOracleFormsScroller</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>ScrollTo</i></a>	Scrolls to the specified position. (Inherited from <a href="#"><i>IOracleFormsScroller</i></a> )
<a href="#"><i>ScrollToMax</i></a>	Scrolls to the maximum position of the scroller. (Inherited from <a href="#"><i>IOracleFormsScroller</i></a> )
<a href="#"><i>ScrollToMin</i></a>	Scrolls to the minimum position of the scroller. (Inherited from <a href="#"><i>IOracleFormsScroller</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Step</i></a>	Increments the current scroll position by specified steps. (Inherited from <a href="#"><i>IOracleFormsScroller</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SplitPaneDivider Class

### Description

Represents a split pane divider.

## Inheritance Hierarchy

- [AWTContainer](#)
  - SplitPaneDivider

## Syntax

```
'Declaration  
Public Class SplitPaneDivider _  
Inherits AWTContainer
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## Win32 Class Reference

Lists the available classes for testing Windows API-based controls.

### AccessibleControl Class

#### Description

The class controls identified by the Accessibility extension.

#### Inheritance Hierarchy

- [\*BaseGuiTestObject\*](#)
  - `AccessibleControl`

## Syntax

```
'Declaration  
Public Class AccessibleControl _  
Inherits BaseGuiTestObject
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Description</a>	The description text of the accessible object.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Role</a>	The role of this accessible object.
<a href="#">State</a>	The state string that describes the different states of this accessible object.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoDefaultAction</a>	Executes the default action of the underlying accessible control supports a default action.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Header Class

### Description

The class for list header controls. Headers are most commonly used in controls of the `ListViewW32` class.

### Inheritance Hierarchy

- [Control](#)
  - Header

### Syntax

```
'Declaration
Public Class Header _
Inherits Control
```

## Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>ColumnCount</i>	The number of columns in the header.
<i>ColumnOrder</i>	The header's item indices as they are currently ordered.
<i>Enabled</i>	Whether the GUI object is enabled. (Inherited from <i>GuiTestObject</i> )
<i>Font</i>	The font type of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DividerDoubleSelect</i>	Double-clicks the divider on the right side of the specified item.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>DoubleSelect</i>	Double-clicks an item.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetColumnName</a>	Returns the title of a specified header item.
<a href="#">GetColumnWidth</a>	Returns the width of a specified column.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Resize</a>	Resizes an item of the header.
<a href="#">Select</a>	Selects an item or button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Listview Class

### Description

The class for elaborated list controls that support multiple ways of viewing a list of nonhierarchical data. These views include large and small rearrangable icons and a detail (or report) view.

### Inheritance Hierarchy

- [Control](#)
  - ListView

### Syntax

```
'Declaration
Public Class ListView _
Inherits Control
```

### Properties

Name	Description
<a href="#">AllowsCheck</a>	Whether this list view supports checking items.
<a href="#">AllowsMultiSelect</a>	Whether the list view supports selecting multiple items.

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">CheckedIndices</a>	A list containing the indices of the checked items.
<a href="#">CheckedItems</a>	A list containing the checked items.
<a href="#">ColumnCount</a>	The number of columns per item.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items contained in the list view.
<a href="#">Items</a>	A list containing all items of the listview.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndices</a>	A list containing the indices of the selected items.
<a href="#">SelectedItems</a>	A list containing the selected items.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks an item.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleSelect</a>	Double-clicks an item.

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExtendSelect</a>	Selects a range of items by extending the selection in the extend-selection listview.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetContents</a>	Returns the contents of a listview control. Each returned item is delimited by a semicolon. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetItemImageIndex</a>	Returns the index into the image list of a list view that contains icons. This allows to verify that the correct image is used for an item.
<a href="#">GetItemIndex</a>	Returns the index of the list view item or -1 if is not found.
<a href="#">GetItemRect</a>	Returns rectangle of the item. If <code>getIconRect</code> is set then the rectangle of the icon of the item will be returned otherwise the rectangle of the item text is returned. If a <code>columnIndex</code> is specified the rectangle of this column is returned.
<a href="#">GetItemText</a>	Returns the text of an item.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>MultiSelect</i></a>	Adds an item in the list to the set of currently selected items.
<a href="#"><i>MultiUnselect</i></a>	Removes an item in the list from the set of selected items.
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Selects an item.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetItemFocus</i></a>	Gives focus to the item in the list.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks an item.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# MonthCalendar Class

## Description

The class that selects the calendar date and time.

## Inheritance Hierarchy

- [Control](#)
  - MonthCalendar

## Syntax

```
'Declaration  
Public Class MonthCalendar _  
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExtendSelect</a>	Selects a range of dates and times.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">OpenMonthMenu</a>	Opens a calendar menu to a specific month.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects a date and time.
<a href="#">SelectNextMonth</a>	Selects the next month.
<a href="#">SelectPreviousMonth</a>	Selects the previous month.
<a href="#">SelectToday</a>	Selects the date for today.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## Pager Class

### Description

The class for tabbed, multi-page dialogs and for button bars. On Windows, this class corresponds to the `TabControl` control. On Windows, Silk Test only supports major tabs; it does not support minor tabs (also called 'subpages' or 'child pages').

## Inheritance Hierarchy

- [Control](#)
  - Pager

## Syntax

```
'Declaration
Public Class Pager _
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Horizontal</a>	Whether the up/down control is horizontal.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollDown</a>	Moves the scroll bar down.
<a href="#">ScrollUp</a>	Moves the scroll bar up.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ProgressBar Class

### Description

The class for progress bar controls. A progress bar displays a progress.

### Inheritance Hierarchy

- [Control](#)
  - ProgressBar

### Syntax

```
'Declaration
Public Class ProgressBar _
Inherits Control
```

## Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Enabled</i>	Whether the GUI object is enabled. (Inherited from <i>GuiTestObject</i> )
<i>Font</i>	The font type of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Position</i>	The current position.
<i>Range</i>	The range of the progress bar control.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## StatusBar Class

### Description

The class for status bar controls. A status bar is a container for a set of text labels that change dynamically.

### Inheritance Hierarchy

- [Control](#)
  - StatusBar

### Syntax

```
'Declaration
Public Class StatusBar _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# UpDown Class

## Description

The class for up/down controls.

## Inheritance Hierarchy

- [Control](#)
  - UpDown
    - [NumericUpDown](#)

## Syntax

```
'Declaration  
Public Class UpDown _  
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Horizontal</a>	Whether the up/down control is horizontal.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	The position for the up/down control.
<a href="#">Range</a>	The range of the up/down control.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WrapAround</a>	Whether values are wrapped if smaller than minimum or larger than maximum.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Decrement</a>	Decreases the position value of the up/down control.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Increment</a>	Increases the position value of the up/down control.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Windows Forms Class Reference

Lists the available classes for testing Windows Forms controls.

# CheckedListBox Class

## Description

CheckedListBox represents list boxes that contain a check box.

## Inheritance Hierarchy

- [ListBox](#)
  - CheckedListBox

## Syntax

```
'Declaration  
Public Class CheckedListBox _  
Inherits ListBox
```

## Properties

Name	Description
<a href="#">AllowsMultiSelect</a>	Whether the control supports selecting multiple items. (Inherited from <a href="#">ListBox</a> )
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">CheckedIndices</a>	The indices of the checked item(s).
<a href="#">CheckedItems</a>	The names of the checked item(s).
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">Items</a>	A list of items in the list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	The index of the first selected item. (Inherited from <a href="#">ListBox</a> )
<a href="#">SelectedIndices</a>	The indices of the selected item(s). (Inherited from <a href="#">ListBox</a> )
<a href="#">SelectedItem</a>	The name of the first selected item. (Inherited from <a href="#">ListBox</a> )
<a href="#">SelectedItems</a>	The names of the selected item(s). (Inherited from <a href="#">ListBox</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Selects an item from the checked list box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleSelect</a>	Double-clicks an item in the list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExtendSelect</a>	Selects a range of items by extending the selection in the list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>MultiSelect</i></a>	Selects an item in the multi- or extend-selection list box. (Inherited from <a href="#"><i>ListBox</i></a> )
<a href="#"><i>MultiUnselect</i></a>	Unselects an item in the multi- or extend-selection list box. (Inherited from <a href="#"><i>ListBox</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">Select</a>	Selects an item from the list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">SelectRange</a>	Selects a range of items in the extend-selection list box. (Inherited from <a href="#">ListBox</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Selects an item from the checked list box.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DataGrid Class

### Description

The class for datagrids and data grid view.

### Inheritance Hierarchy

- [Control](#)
  - DataGrid

### Syntax

```
'Declaration
Public Class DataGrid _
Inherits Control
```

### Properties

Name	Description
<a href="#">AllowsMultiSelect</a>	Whether the table supports selecting multiple items.
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ColumnCount</a>	The number of columns in the DataGrid.
<a href="#">ColumnItems</a>	A list of all items in the column.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Items</a>	A list of all items in the column.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )

Name	Description
<i>RowCount</i>	The number of rows in the DataGrid.
<i>RowItems</i>	A list of all items in the row.
<i>SelectedItems</i>	The selected item(s).
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>DoubleSelectedItem</i>	Double-clicks an item.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>ExtendSelectedItem</i>	Expands the selection to the given item.
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHorizontalBar</i></a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>MultiSelectItem</i></a>	Adds a row from the table to the set of selected rows.
<a href="#"><i>MultiUnselectItem</i></a>	Removes a item from the set of selected items.
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Tries to bring the item to the top left corner of the datagrid.
<a href="#">SelectAllItems</a>	Selects all items in the datagrid.
<a href="#">SelectItem</a>	Selects an item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DataGridColumn Class

### Description

The class for columns in a table.

### Inheritance Hierarchy

- [Item](#)
  - DataGridColumn

### Syntax

```
'Declaration
Public Class DataGridColumn _
Inherits Item
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Width</a>	The width of the column.

## Methods

Name	Description
<a href="#">AutoSize</a>	Automatically resizes a column by double clicking its divider.
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Resize</a>	Resizes a column.
<a href="#">ScrollIntoView</a>	Tries to bring the column to the left by scrolling the data grid.
<a href="#">Select</a>	Selects a column.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# DataGridItem Class

## Description

The class for datagrids and data grid view rows.

## Inheritance Hierarchy

- [Item](#)
  - DataGridItem

## Syntax

```
'Declaration  
Public Class DataGridItem _  
Inherits Item
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Column</a>	The column of the item in the data grid
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Row</a>	The row of the item in the data grid
<a href="#">Selected</a>	Whether the item is selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Tries to bring the item to the top left corner of the datagrid.
<a href="#">Select</a>	Selects an item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DataGridRow Class

### Description

The class for rows in a table.

### Inheritance Hierarchy

- [Item](#)
  - `DataGridRow`

### Syntax

```
'Declaration
Public Class DataGridRow _
Inherits Item
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Height</a>	The width of the column.
<a href="#">ItemCount</a>	The number of items in the row.
<a href="#">Items</a>	A list of items in the row.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Resize</a>	Resizes a column.
<a href="#">ScrollIntoView</a>	Tries to bring the row to the top by scrolling the data grid.
<a href="#">Select</a>	Selects a column.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## DomainUpDown Class

### Description

The class for up/down controls.

### Inheritance Hierarchy

- [\*Control\*](#)
  - DomainUpDown

### Syntax

```
'Declaration
Public Class DomainUpDown _
Inherits Control
```

### Properties

Name	Description
<a href="#"><i>Background</i></a>	The background color of the GUI object. (Inherited from <a href="#"><i>GuiTestObject</i></a> )
<a href="#"><i>Enabled</i></a>	Whether the GUI object is enabled. (Inherited from <a href="#"><i>GuiTestObject</i></a> )
<a href="#"><i>Font</i></a>	The font type of the GUI object. (Inherited from <a href="#"><i>GuiTestObject</i></a> )
<a href="#"><i>Foreground</i></a>	The foreground color of the GUI object. (Inherited from <a href="#"><i>GuiTestObject</i></a> )
<a href="#"><i>ItemCount</i></a>	The number of items contained in the list view.
<a href="#"><i>Items</i></a>	The items in the domain up/down control.

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	The position for the up/down control.
<a href="#">SelectedItem</a>	The position for the up/down control.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WrapAround</a>	Whether values are wrapped if smaller than minimum or larger than maximum.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Decrement</a>	Decreases the position value of the up/down control.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHorizontalBar</i></a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Increment</i></a>	Increases the position value of the up/down control.
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects an item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ElementHost Class

### Description

A Windows Forms control that can be used to host a Windows Presentation Foundation (WPF) element.

### Inheritance Hierarchy

- [Control](#)
  - ElementHost

### Syntax

```
'Declaration
Public Class ElementHost _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# FormsHost Class

## Description

An element that allows you to host a Windows Forms control on a WPF page.

## Inheritance Hierarchy

- [Control](#)
  - FormsHost

## Syntax

```
'Declaration  
Public Class FormsHost _  
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	<p>OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p> <p>Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForProperty</a>	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForPropertyNotEquals</a>	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForScreenshotStable</a>	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>

## FormsWindow Class

### Description

FormsWindow is the class that represents the top-level window of a Windows Forms application.

### Inheritance Hierarchy

- [Window](#)
  - FormsWindow

### Syntax

```
'Declaration
Public Class FormsWindow _
Inherits Window
```

## Properties

Name	Description
<a href="#">Application</a>	The name of the Application that this Window belongs to. (Inherited from <a href="#">Window</a> )
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetCloseWindows</i></a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetFocus</i></a>	Returns the object with the input focus. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetHorizontalBar</i></a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>GetNextCloseWindow</i></a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">LoadAssembly</a>	Loads the assembly on the specified path in the Windows Forms application.
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## MenuStrip Class

### Description

MenuStrip is the class that creates a new menu strip for a Windows Forms application.

## Inheritance Hierarchy

- [Control](#)
  - MenuStrip

## Syntax

```
'Declaration
Public Class MenuStrip _
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## NumericUpDown Class

### Description

The class for numeric up/down controls.

### Inheritance Hierarchy

- [UpDown](#)
  - NumericUpDown

### Syntax

```
'Declaration
Public Class NumericUpDown _
Inherits UpDown
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )

Name	Description
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Horizontal</a>	Whether the up/down control is horizontal. (Inherited from <a href="#">UpDown</a> )
<a href="#">Maximum</a>	The maximum value of the up/down control.
<a href="#">Minimum</a>	The minimum value of the up/down control.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	The position for the up/down control. (Inherited from <a href="#">UpDown</a> )
<a href="#">PositionDecimal</a>	The position for the up/down control.
<a href="#">Range</a>	The range of the up/down control. (Inherited from <a href="#">UpDown</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WrapAround</a>	Whether values are wrapped if smaller than minimum or larger than maximum. (Inherited from <a href="#">UpDown</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Decrement</a>	Decreases the position value of the up/down control. (Inherited from <a href="#">UpDown</a> )
<a href="#">DecrementDecimal</a>	Decreases the position value of the up/down control.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHorizontalBar</i></a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Increment</i></a>	Increases the position value of the up/down control. (Inherited from <a href="#"><i>UpDown</i></a> )
<a href="#"><i>IncrementDecimal</i></a>	Increases the position value of the up/down control.
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## xBrowser Class Reference

Lists the available classes for testing xBrowser controls.

### BrowserApplication Class

#### Description

Represents the top-level window of a browser application.

**Note:** `BrowserApplication` is derived from `BaseGuiTestObject` and inherits the two scrollbar methods `GetHorizontalBar` and `GetVerticalBar`. However, these two methods do not work on a `BrowserApplication`.

#### Inheritance Hierarchy

- [Window](#)
  - `BrowserApplication`

#### Syntax

```
'Declaration
Public Class BrowserApplication _
Inherits Window
```

## Properties

Name	Description
<a href="#">Application</a>	The name of the Application that this Window belongs to. (Inherited from <a href="#">Window</a> )
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearCache</a>	Clears the browser's cache.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseOtherTabs</a>	Closes all tabs except the active one. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. This method closes all other tabs except for the selected one, including the tabs that are not currently visible. This method is not supported for mobile Web applications.
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">CloseTab</a>	Closes the specified tab. If no tab is specified, the active tab is closed. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be closed. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExistsTab</a>	Returns true if the tab exists and false otherwise. This method is not supported for mobile Web applications.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetActiveTab</a>	Returns the active tab. This method is not supported for mobile Web applications.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetSelectedTab</a>	Returns the currently selected tab. This method is not supported for mobile Web applications.
<a href="#">GetSelectedTabIndex</a>	Returns the index of the active tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the index relative to the currently visible tabs. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
<a href="#">GetSelectedTabName</a>	Returns the name of the active tab. This method is not supported for mobile Web applications.
<a href="#">GetTabCount</a>	Returns the number of open tabs. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the number of currently visible tabs. This method is not supported for mobile Web applications.
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">Navigate</a>	Navigate to the specified URL in the currently active tab/window
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">OpenTab</a>	Opens a new tab and navigates to the given URL. If no URL is given, the tab navigates to about:blank. This method is not supported for mobile Web applications.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SelectTab</a>	Selects the specified tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be selected. Index 0 selects the first visible tab. This method is not supported for mobile Web applications.
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## BrowserObject Class

### Description

Base class for all objects that are contained within a `BrowserApplication`.

### Inheritance Hierarchy

- [TestObject](#)
  - `BrowserObject`
    - [BrowserWindow](#)
    - [DomElement](#)

### Syntax

```
'Declaration
Public Class BrowserObject _
```

Inherits `TestObject` \_  
Implements `IClickable`, `IKeyable`

## Properties

Name	Description
<code>Text</code>	The text of the control. (Inherited from <code>TestObject</code> )
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code> )
<code>Visible</code>	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this property when an already located object in the application under test gets invisible during replay.

## Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <code>TestObject</code> )
<code>Click</code>	Clicks on the object. (Inherited from <code>IClickable</code> )
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <code>IClickable</code> )
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <code>TestObject</code> )
<code>Exists</code>	Checks if an object exists in the application under test. (Inherited from <code>TestObject</code> )
<code>Find</code>	Finds an object specified by an XPath locator. (Inherited from <code>TestObject</code> )
<code>FindAll</code>	Finds all objects specified by an XPath locator. (Inherited from <code>TestObject</code> )
<code>GenerateLocator</code>	Returns a locator for this object. (Inherited from <code>TestObject</code> )
<code>GetChildren</code>	Returns the child objects of this object. (Inherited from <code>TestObject</code> )
<code>GetDynamicMethodList</code>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <code>TestObject</code> )
<code>GetParent</code>	Looks up the parent of this object in the test application. (Inherited from <code>TestObject</code> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# BrowserWindow Class

## Description

A browser window is the top-level container for a web page. It exposes the DOM tree through `DomElements`. E.g. a tab in IE7, an embedded browser control in SWT.

## Inheritance Hierarchy

- [BrowserObject](#)
  - BrowserWindow

## Syntax

```
'Declaration
Public Class BrowserWindow _
Inherits BrowserObject
```

## Properties

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ViewportHeight</a>	The height of the browser viewport
<a href="#">ViewportName</a>	The name of the viewport that matches the <code>innerWidth</code> and <code>innerHeight</code> of the browser window
<a href="#">ViewportOrientation</a>	The orientation of the browser viewport, this can be portrait or landscape
<a href="#">ViewportWidth</a>	The width of the browser viewport
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">AcceptAlert</a>	Accepts a JavaScript alert by pressing OK.
<a href="#">Back</a>	Goes back in the history.
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">CaptureFullPageBitmap</a>	Capture a screenshot of the whole web page and save it as a file to the specified path. The filename extension determines the file type. Possible extensions are .jpg, .jpeg, .png, and .bmp.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Close a modal browser dialog, a tab of the browser, or the browser itself if it is the last tab (or IE6).
<a href="#">DismissAlert</a>	Dismisses a JavaScript alert.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates JavaScript code within the top-level document context.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">Forward</a>	Goes forward in the history.
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetAlertText</a>	Retrieves the message text of a JavaScript alert.
<a href="#">GetBrowserMajorVersion</a>	Returns the browser's major version number.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of the BrowserWindow in HTML pixels. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not affected by changing zoom levels on mobile browsers.
<a href="#">GetPageSource</a>	Returns the page source of the web site
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetUrl</a>	Returns the URL for the main document.
<a href="#">GetUserAgent</a>	Returns the browser's user agent string
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsAlertPresent</a>	Returns true if a JavaScript alert is open
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Navigate</a>	Navigates the main document to an URL.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Reload</a>	Reloads the main document as the reload button in the browser does.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">SetViewportName</a>	Set the size of the browser window to the specified size from your Browser Size list.
<a href="#">SetViewportSize</a>	Sets the size of the browser window to the specified width and height.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomButton Class

### Description

A `DomButton` represents all DOM elements that were specified using one of the following tags: `<input type='submit'>`, `<input type='reset'>`, `<input type='button'>` or `<button>`.

### Inheritance Hierarchy

- [DomElement](#)
  - `DomButton`

### Syntax

```
'Declaration
Public Class DomButton _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all

Name	Description
	DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">Select</a>	Clicks a button.
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomCheckBox Class

### Description

A DomCheckBox represents all DOM elements that were specified using <input type='checkbox'> tag.

### Inheritance Hierarchy

- [DomElement](#)
  - DomCheckBox

### Syntax

```
'Declaration
Public Class DomCheckBox _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">State</a>	The state of a check box. Values include: 1=checked,2=unchecked, 3=undecided
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#"><i>GetDomAttributeList</i></a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHtmlRect</i></a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetText</i></a>	Gets the visible text of a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>Highlight</i></a>	Highlights a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">IsChecked</a>	Returns <i>true</i> if the checkbox is checked and <i>false</i> otherwise.
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">Select</a>	Selects the check box
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetUndecided</a>	Sets the check box to the undecided state.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Toggles the state of the check box. If the checkbox is checked it is unchecked and vice versa. If the checkbox is in the undecided state it is left undecided.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box.
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomDataList Class

### Description

A DomDataList represents an input element with pre-defined values in a <datalist> element.

### Inheritance Hierarchy

- [DomTextField](#)
  - DomDataList

### Syntax

```
'Declaration
Public Class DomDataList _
```

Inherits DomTextField \_  
Implements IItemSelectable

## Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">IsPassword</a>	whether the text field is a password text field. (Inherited from <a href="#">DomTextField</a> )
<a href="#">ItemCount</a>	the number of items in the listbox. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">Items</a>	the list of items in the listbox. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearText</a>	Clears the textfield's text (Inherited from <a href="#">DomTextField</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">Select</a>	Selects an item. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetText</a>	Sets the text. (Inherited from <a href="#">DomTextField</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomElement Class

### Description

A DomElement represents any element in the DOM tree.

### Inheritance Hierarchy

- [BrowserObject](#)
  - DomElement
    - [DomButton](#)
    - [DomCheckBox](#)
    - [DomEmbeddedElement](#)
    - [DomForm](#)
    - [DomLink](#)
    - [DomListBox](#)
    - [DomRadioButton](#)
    - [DomTable](#)
    - [DomTableRow](#)
    - [DomTextField](#)

### Syntax

```
'Declaration
Public Class DomElement _
Inherits BrowserObject
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses.
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name.
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute.
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element.
<a href="#">Highlight</a>	Highlights a DOM element.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window.
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomEmbeddedElement Class

### Description

A DOM element that was specified by an <embed> or <object> tag.

### Inheritance Hierarchy

- [DomElement](#)
  - DomEmbeddedElement

### Syntax

```
'Declaration
Public Class DomEmbeddedElement _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#"><i>GetDomAttributeList</i></a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHtmlRect</i></a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetText</i></a>	Gets the visible text of a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>Highlight</i></a>	Highlights a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomForm Class

### Description

A `DomForm` represents all DOM elements that were specified using the `<form>` tag. All methods and properties in this class are not supported for mobile Web applications.

### Inheritance Hierarchy

- [DomElement](#)
  - `DomForm`

### Syntax

```
'Declaration
Public Class DomForm _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Submit</a>	Submits the form.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional

Name	Description
<a href="#">WaitForDisappearance</a>	<p>timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p> <p>Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForObject</a>	<p>Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForProperty</a>	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForPropertyNotEquals</a>	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForScreenshotStable</a>	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>

## DomLink Class

### Description

A `DomLink` represents all DOM elements that were specified using the `<a>` tag.

### Inheritance Hierarchy

- [DomElement](#)
  - `DomLink`

## Syntax

```
'Declaration
Public Class DomLink _
Inherits DomElement
```

## Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">Select</a>	Clicks a link.
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomListBox Class

### Description

A `DomListBox` represents all DOM elements that were specified using the `<select>` tag.

## Inheritance Hierarchy

- [DomElement](#)
  - DomListBox

## Syntax

```
'Declaration
Public Class DomListBox _
Inherits DomElement _
Implements IItemSelectable
```

## Properties

Name	Description
<a href="#">AllowsMultiSelect</a>	whether the control is multiselectable.
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">ItemCount</a>	the number of items in the listbox. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">Items</a>	the list of items in the listbox. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">SelectedIndices</a>	The indices of the selected item(s).
<a href="#">SelectedItems</a>	The names of the selected item(s).
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for

Name	Description
<a href="#">DomMouseMove</a>	DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">ExecuteJavaScript</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Returns the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MultiSelect</a>	Selects a list of items.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#">Select</a>	Selects an item. (Inherited from <a href="#">IItemSelectable</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">Unselect</a>	Unselects an item.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomRadioButton Class

### Description

A DomRadioButton represents all DOM elements that were specified using <input type='radio'> tag.

### Inheritance Hierarchy

- [DomElement](#)
  - DomRadioButton

### Syntax

```
'Declaration
Public Class DomRadioButton _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">RadioListItemCount</a>	The number of items in the radiolist. This property is not supported for mobile Web applications.
<a href="#">RadioListItems</a>	the list of items in the radio list
<a href="#">RadioListSelectedIndex</a>	The index of the selected item. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
<a href="#">RadioListSelectedItem</a>	The item that is selected in the radiolist. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
<a href="#">Selected</a>	whether the radio button is selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">RadioListSelect</a>	Selects an item in the radio list.
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">Select</a>	Selects the radio button.
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomTable Class

### Description

A `DomTable` represents the `<table>` tag. All methods and properties in this class are not supported for mobile Web applications.

### Inheritance Hierarchy

- [DomElement](#)

- DomTable

## Syntax

```
'Declaration
Public Class DomTable _
Inherits DomElement
```

## Properties

Name	Description
<i>IsFocused</i>	Whether the DOM element has focus. (Inherited from <i>DomElement</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>BrowserObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DomClick</i>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <i>DomElement</i> )
<i>DomDoubleClick</i>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i> )
<i>DomMouseMove</i>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>ExecuteJavaScript</i>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <i>DomElement</i> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetCell</i></a>	Returns the specified cell.
<a href="#"><i>GetCellText</i></a>	Returns the content of a cell element.
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetColumnCount</i></a>	Number of columns of the table.
<a href="#"><i>GetCssStyle</i></a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetDomAttribute</i></a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetDomAttributeList</i></a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHtmlRect</i></a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRow</a>	Returns the DOM element for the specified row.
<a href="#">GetRowCount</a>	Returns the number of rows
<a href="#">GetRows</a>	Returns a list of rows (DomTableRows)
<a href="#">GetRowText</a>	Returns the content of all cell elements of a specified row.
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomTableRow Class

### Description

A DomTableRow represents the <tr> tag. All methods and properties in this class are not supported for mobile Web applications.

### Inheritance Hierarchy

- [DomElement](#)
  - DomTableRow

### Syntax

```
'Declaration
Public Class DomTableRow _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCell</a>	Returns the DOM element in the given cell.
<a href="#">GetCellCount</a>	Returns the number of cells in this table row
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHtmlRect</i></a>	Retrieves the rectangle of a <i>DomElement</i> relative to the <i>BrowserWindow</i> in HTML pixels. In contrast to the screen coordinates that are provided by the <i>GetRect</i> function, the coordinates provided by <i>GetHtmlRect</i> are not affected by the zoom level on mobile browsers. The <i>click</i> function also uses HTML pixel coordinates for all <i>DomElements</i> . We recommend to use <i>GetHtmlRect</i> for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetText</i></a>	Gets the visible text of a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>Highlight</i></a>	Highlights a DOM element. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetDomAttribute</a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">BrowserObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Unhighlight</a>	Restores the original foreground and background colors. (Inherited from <a href="#">DomElement</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## DomTextField Class

### Description

A `DomTextField` represents DOM elements that were specified using one of the following tags: `<input type='text'>`, `<input type='password'>`, `<input type='file'>` or `<textarea>`.

### Inheritance Hierarchy

- [DomElement](#)
  - `DomTextField`
    - [DomDataList](#)

### Syntax

```
'Declaration
Public Class DomTextField _
Inherits DomElement
```

### Properties

Name	Description
<a href="#">IsFocused</a>	Whether the DOM element has focus. (Inherited from <a href="#">DomElement</a> )
<a href="#">IsPassword</a>	whether the text field is a password text field.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">BrowserObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearText</a>	Clears the textfield's text
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DomClick</a>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomDoubleClick</a>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DomMouseMove</a>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">ExecuteJavaScript</a>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <a href="#">DomElement</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCssStyle</a>	Retrieves the computed CSS style with the specified style name. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttribute</a>	Gets the value of an object specific DOM attribute. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDomAttributeList</a>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHtmlRect</a>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <a href="#">DomElement</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetText</a>	Gets the visible text of a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">Highlight</a>	Highlights a DOM element. (Inherited from <a href="#">DomElement</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>SetDomAttribute</i></a>	Sets the value of an object specific DOM attribute. (Inherited from <a href="#"><i>DomElement</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>BrowserObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetText</i></a>	Sets the text.
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>Unhighlight</i></a>	Restores the original foreground and background colors. (Inherited from <a href="#"><i>DomElement</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ItemSelectable Interface

### Description

A `ItemSelectable` provides a list of items of which one can be selected.

### Syntax

```
'Declaration
Public Class IItemSelectable
```

## Properties

Name	Description
<i>ItemCount</i>	the number of items in the listbox.
<i>Items</i>	the list of items in the listbox.

## Methods

Name	Description
<i>Select</i>	Selects an item.
