<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkPanel Class

### Description

The `Panel` class defines a container that includes a title bar, a caption, a border, and a content area for its children.

## Inheritance Hierarchy

- *SparkSkinnableContainer*
  - SparkPanel
    - *SparkTitleWindow*

## Syntax

```
'Declaration  
Public Class SparkPanel _  
Inherits SparkSkinnableContainer
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>controlBarVisible</i>	a value whether the control bar is visible.
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i> )
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>title</i>	the title or caption displayed in the title bar.

Name	Description
<code>toolTip</code>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <code>FlexObject</code> )
<code>useHandCursor</code>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <code>FlexObject</code> )
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code> )
<code>visible</code>	whether the display object is visible. (Inherited from <code>FlexDisplayObject</code> )
<code>width</code>	the width of the display object, in pixels. (Inherited from <code>FlexDisplayObject</code> )
<code>x</code>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <code>FlexDisplayObject</code> )
<code>y</code>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <code>FlexDisplayObject</code> )

## Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <code>TestObject</code> )
<code>ChangeFocus</code>	Changes the current focus. (Inherited from <code>FlexObject</code> )
<code>Click</code>	Clicks on the object. (Inherited from <code>IClickable</code> )
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <code>IClickable</code> )
<code>DragCancel</code>	Dispatched when a drag operation is cancelled. (Inherited from <code>SparkSkinnableContainerBase</code> )
<code>DragDrop</code>	Dispatched when the dragged item is dropped. (Inherited from <code>SparkSkinnableContainerBase</code> )
<code>DragStart</code>	Dispatched when the drag/drop operation begins. (Inherited from <code>SparkSkinnableContainerBase</code> )
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <code>TestObject</code> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyle</i></a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>GetValues</i></a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkPopUpAnchor Class

### Description

Identifies a Spark PopUpAnchor control.

### Inheritance Hierarchy

- [FlexObject](#)
  - SparkPopUpAnchor

### Syntax

```
'Declaration
Public Class SparkPopUpAnchor _
Inherits FlexObject
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>displayPopUp</i>	whether the popUp is visible.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>popUpHeightMatchesAnchorHeight</i>	whether the height of the popUp control is set to the value of the PopUpAnchor's height.

Name	Description
<i>popUpPosition</i>	the position of the popUp control when it is opened, relative to the PopUpAnchor component.
<i>popUpWidthMatchesAnchorWidth</i>	whether the width of the popUp control is set to the value of the PopUpAnchor's width.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ToString</i></a>	Returns a string representation of the control. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#"><i>WaitForDisappearance</i></a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <a href="#"><i>WaitForObject</i></a> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <a href="#"><i>WaitForObject</i></a> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <a href="#"><i>WaitForObject</i></a> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## SparkRadioButton Class

### Description

The [\*RadioButton\*](#) component allows the user make a single choice within a set of mutually exclusive choices. A [\*RadioButtonGroup\*](#) is composed of two or more [\*RadioButton\*](#) components with the same `groupName` property.

### Inheritance Hierarchy

- [\*SparkToggleButtonBase\*](#)
  - [\*SparkRadioButton\*](#)

## Syntax

```
'Declaration
Public Class SparkRadioButton _
Inherits SparkToggleButtonBase
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">autoRepeat</a>	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<a href="#">groupName</a>	the name of the group to which this RadioButton component belongs, or specifies the value of the id property of a RadioButtonGroup component if this RadioButton is part of a group defined by a RadioButtonGroup component.
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">label</a>	the text to appear on the ButtonBase control. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i> )
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyle</i></a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkRange Class

### Description

The Range class holds a value and an allowed range for that value, defined by minimum and maximum properties.

### Inheritance Hierarchy

- [SparkObject](#)
  - SparkRange
    - [SparkSpinner](#)
    - [SparkTrackBase](#)

### Syntax

```
'Declaration
Public Class SparkRange _
Inherits SparkObject
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>maximum</i>	The maximum valid value.
<i>minimum</i>	The minimum valid value.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the snapInterval.
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )

Name	Description
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>value</i>	The current value for this range.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkRichEditableText Class

### Description

RichEditableText is a low-level UIComponent for displaying, scrolling, selecting, and editing richly-formatted text.

### Inheritance Hierarchy

- [SparkObject](#)
  - SparkRichEditableText

### Syntax

```
'Declaration
Public Class SparkRichEditableText _
Inherits SparkObject
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">clipAndEnableScrolling</a>	whether to clip the children to the boundaries of the viewport.
<a href="#">columnNames</a>	a list containing the names of all columns in the data.
<a href="#">contentHeight</a>	The height of the text.

Name	Description
<code>contentWidth</code>	The width of the text.
<code>currentState</code>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<code>displayAsPassword</code>	whether the text field is a password text field.
<code>editable</code>	A flag indicating whether the user is allowed to edit the text in this control.
<code>enabled</code>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<code>enableIME</code>	A flag that indicates whether the IME should be enabled when the component receives focus.
<code>errorColor</code>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<code>errorString</code>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<code>firstVisibleRow</code>	the index of the first visible child.
<code>focusEnabled</code>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<code>height</code>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<code>heightInLines</code>	The default height of the control, measured in lines.
<code>horizontalScrollPosition</code>	The number of pixels by which the text is scrolled horizontally.
<code>id</code>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<code>imeMode</code>	the IME (input method editor) mode.
<code>lastVisibleRow</code>	the index of the last visible child.
<code>maxChars</code>	The maximum number of characters that the text field can contain, as entered by a user.
<code>mouseEnabled</code>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <a href="#">FlexDisplayObject</a> )
<code>multiline</code>	whether the user can enter multiline text.
<code>numAutomationChildren</code>	the number of automation children this container has. (Inherited from <a href="#">FlexObject</a> )
<code>numColumns</code>	the total number of columns in the data available.
<code>numRows</code>	the total number of rows of data available.

Name	Description
<a href="#"><i>percentHeight</i></a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>percentWidth</i></a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>restrict</i></a>	the set of characters that a user can enter into the text field.
<a href="#"><i>scaleX</i></a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>scaleY</i></a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>selectable</i></a>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.
<a href="#"><i>selectionActivePosition</i></a>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
<a href="#"><i>selectionAnchorPosition</i></a>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
<a href="#"><i>selectionHighlighting</i></a>	a value whether the text selection is highlighted.
<a href="#"><i>tabChildren</i></a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>tabEnabled</i></a>	whether this object is in the tab order. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>tabIndex</i></a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TextObject</i></a> )
<a href="#"><i>text</i></a>	The text String displayed by this component.
<a href="#"><i>themeColor</i></a>	the theme color of a component. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>toolTip</i></a>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>useHandCursor</i></a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>Value</i></a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#"><i>TextObject</i></a> )
<a href="#"><i>verticalScrollPosition</i></a>	The number of pixels by which the text is scrolled vertically.
<a href="#"><i>visible</i></a>	whether the display object is visible. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>width</i></a>	the width of the display object, in pixels. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>widthInChars</i></a>	The default width of the control, measured in em units.

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Input</a>	Dispatched when the user types, deletes, or pastes text into the control.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MouseScroll</a>	Dispatched when the mouse is used to move the scroll bars on this container.
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectText</a>	Dispatched when text is selected.
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkRichText Class

### Description

RichText is a low-level UIComponent that can display one or more lines of richly-formatted text and embedded images.

### Inheritance Hierarchy

- [SparkTextBase](#)
  - SparkRichText

### Syntax

```
'Declaration
Public Class SparkRichText _
Inherits SparkTextBase
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>isTruncated</i>	whether the text has been truncated. (Inherited from <i>SparkTextBase</i> )
<i>luminosityClip</i>	whether the luminosity mask clips the masked content.
<i>luminosityInvert</i>	whether the calculation of the RGB color value of a graphic element is masked by a luminosity mask.
<i>maskType</i>	how the mask is applied to the component. The possible values are <i>MaskType.CLIP</i> , <i>MaskType.ALPHA</i> and <i>MaskType.LUMINOSITY</i> . Clip Masking When masking in clip mode, a clipping masks is reduced to 1-bit.
<i>maxDisplayedLines</i>	An integer which determines whether, and where, the text gets truncated. (Inherited from <i>SparkTextBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i> )

Name	Description
<a href="#">scaleX</a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">scaleY</a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TextObject</a> )
<a href="#">text</a>	The text displayed by this text component. (Inherited from <a href="#">SparkTextBase</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TextObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TextObject</a> )

Name	Description
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled. (Inherited from <a href="#">SparkTextBase</a> )
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped. (Inherited from <a href="#">SparkTextBase</a> )
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins. (Inherited from <a href="#">SparkTextBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkTextBase</a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkScrollBar Class

### Description

The `ScrollBarBase` class helps to position the portion of data that is displayed when there is too much data to fit in a display area.

## Inheritance Hierarchy

- [SparkTrackBase](#)
  - SparkScrollBar

## Syntax

```
'Declaration
Public Class SparkScrollBar _
Inherits SparkTrackBase
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">maximum</a>	The maximum valid value. (Inherited from <a href="#">SparkRange</a> )
<a href="#">minimum</a>	The minimum valid value. (Inherited from <a href="#">SparkRange</a> )
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any <a href="#">InteractiveObject</a> instance that is on the display list receives mouse events. If <a href="#">mouseEnabled</a> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <a href="#">mouseEnabled</a> behavior for all children of an object on the display list, use <a href="#">flash.display.DisplayObjectContainer.mouseChildren</a> . (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>pageSize</i>	The change in the value of the value property when you call the <i>changeValueByPage()</i> method.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the <i>snapInterval</i> . (Inherited from <i>SparkRange</i> )
<i>stepSize</i>	The amount that the value property changes when the <i>changeValueByStep()</i> method is called. (Inherited from <i>SparkRange</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>value</i>	The current value for this range. (Inherited from <i>SparkRange</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Change</a>	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSkinnableContainer Class

### Description

The SparkSkinnableContainer class is the base class for skinnable containers that have visual content.

### Inheritance Hierarchy

- [SparkSkinnableContainerBase](#)
  - SparkSkinnableContainer
    - [SparkApplication](#)
    - [SparkBorderContainer](#)
    - [SparkForm](#)
    - [SparkFormItem](#)
    - [SparkNavigatorContent](#)
    - [SparkPanel](#)
    - [SparkSkinnablePopUpContainer](#)
    - [SparkWindow](#)

### Syntax

```
'Declaration
Public Class SparkSkinnableContainer _
Inherits SparkSkinnableContainerBase
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">autoLayout</a>	whether measurement and layout are done when the position or size of a child is changed.
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )

Name	Description
<i>creationPolicy</i>	the content creation policy for this component.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>deferredContentCreated</i>	whether deferred content has been created.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numElements</i>	The number of visual elements in this container.
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )

Name	Description
<a href="#">scaleY</a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ToString</i></a>	Returns a string representation of the control. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSkinnableContainerBase Class

### Description

Base class for spark container components.

### Inheritance Hierarchy

- [SparkObject](#)
  - SparkSkinnableContainerBase

- [SparkDataGrid](#)
- [SparkSkinnableContainer](#)
- [SparkSkinnableDataContainer](#)

## Syntax

```
'Declaration
Public Class SparkSkinnableContainerBase _
Inherits SparkObject
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data.
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">firstVisibleRow</a>	the index of the first visible child.
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">lastVisibleRow</a>	the index of the last visible child.
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled.
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped.
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SparkSkinnableDataContainer Class

## Description

The SkinnableDataContainer class is the base container class for data items.

## Inheritance Hierarchy

- [SparkSkinnableContainerBase](#)
  - SparkSkinnableDataContainer
    - [SparkListBase](#)

## Syntax

```
'Declaration  
Public Class SparkSkinnableDataContainer _  
Inherits SparkSkinnableContainerBase
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">autoLayout</a>	the measurement and layout are done when the position or size of a child is changed.
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">firstVisibleRow</a>	the index of the first visible child. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )

Name	Description
<a href="#"><i>useHandCursor</i></a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>Value</i></a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>visible</i></a>	whether the display object is visible. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>width</i></a>	the width of the display object, in pixels. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>x</i></a>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>y</i></a>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )

## Methods

Name	Description
<a href="#"><i>CaptureBitmap</i></a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ChangeFocus</i></a>	Changes the current focus. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>Click</i></a>	Clicks on the object. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>DoubleClick</i></a>	Double-clicks a mouse button on the object. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>DragCancel</i></a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>DragDrop</i></a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>DragStart</i></a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSkinnablePopUpContainer Class

### Description

Identifies a `SparkSkinnablePopUpContainer` control.

### Inheritance Hierarchy

- [SparkSkinnableContainer](#)
  - `SparkSkinnablePopUpContainer`

### Syntax

```
'Declaration
Public Class SparkSkinnablePopUpContainer _
Inherits SparkSkinnableContainer
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>isOpen</i>	whether the container is open.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i> )
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSkinnableTextBase Class

### Description

The base class for skinnable components, such as the Spark TextInput and TextArea, that include an instance of RichEditableText in their skin to provide rich text display, scrolling, selection, and editing.

### Inheritance Hierarchy

- [SparkObject](#)
  - SparkSkinnableTextBase
    - [SparkTextArea](#)
    - [SparkTextInput](#)

### Syntax

```
'Declaration
Public Class SparkSkinnableTextBase _
Inherits SparkObject
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data.
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">displayAsPassword</a>	whether the text field is a password text field.

Name	Description
<i>editable</i>	A flag indicating whether the user is allowed to edit the text in this control.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>enableIME</i>	A flag that indicates whether the IME should be enabled when the component receives focus.
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>imeMode</i>	the IME (input method editor) mode.
<i>lastVisibleRow</i>	the index of the last visible child.
<i>maxChars</i>	The maximum number of characters that the text field can contain, as entered by a user.
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>restrict</i>	the set of characters that a user can enter into the text field.

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
<i>selectionHighlighting</i>	a value whether the text selection is highlighted.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>text</i>	The text String displayed by this component.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Input</a>	Dispatched when the user types, deletes, or pastes text into the control.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MouseScroll</a>	Dispatched when the mouse is used to move the scroll bars on this container.
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectText</a>	Dispatched when text is selected.
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSlider Class

### Description

Lets users select a value by moving a slider thumb between the end points of the slider track.

### Inheritance Hierarchy

- [SparkTrackBase](#)
  - SparkSlider
    - [SparkVolumeBar](#)

### Syntax

```
'Declaration
Public Class SparkSlider _
Inherits SparkTrackBase
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i> )
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i> )
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">value</a>	The current value for this range. (Inherited from <a href="#">SparkRange</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Change</a>	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkSpinner Class

### Description

A Spinner component selects a value from an ordered set. It uses two buttons that increase or decrease the current value based on the current value of the stepSize property.

### Inheritance Hierarchy

- [SparkRange](#)
  - SparkSpinner
    - [SparkNumericStepper](#)

### Syntax

```
'Declaration
Public Class SparkSpinner _
Inherits SparkRange
```

### Properties

Name	Description
<a href="#">allowValueWrap</a>	the behavior of the control for a step when the current value is either the maximum or minimum value.
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i> )
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i> )
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i> )

Name	Description
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">value</a>	The current value for this range. (Inherited from <a href="#">SparkRange</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Change</a>	Dispatched when the value of the <code>NumericStepper</code> changes as a result of user interaction.
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<a href="#">WaitForObject</a>	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTabBar Class

### Description

The TabBar class displays a set of identical tabs. One tab can be selected at a time, and the first tab is selected by default.

### Inheritance Hierarchy

- [SparkListBase](#)
  - SparkTabBar

### Syntax

```
'Declaration
Public Class SparkTabBar _
Inherits SparkListBase
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>autoLayout</i>	the measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableDataContainer</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>caretIndex</i>	The item that is currently in focus. (Inherited from <i>SparkListBase</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>requireSelection</i>	a value if a data item must always be selected in the control (Inherited from <i>SparkListBase</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>selectedIndex</i>	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from <i>SparkListBase</i> )
<i>selectedItem</i>	The item that is currently selected. (Inherited from <i>SparkListBase</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>useVirtualLayout</i>	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from <i>SparkListBase</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetItemsCount</a>	Gets the number of items in the ComboBox. (Inherited from <a href="#">SparkListBase</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Dispatched when an item in the list is selected. (Inherited from <a href="#"><i>SparkListBase</i></a> )
<a href="#"><i>SelectIndex</i></a>	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ToString</i></a>	Returns a string representation of the control. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>Type</i></a>	Dispatched when the user presses a key. (Inherited from <a href="#"><i>SparkListBase</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTextArea Class

### Description

TextArea is a text-entry control that lets users enter and edit multiple lines of richly formatted text. It can display horizontal and vertical scrollbars for scrolling through the text and supports vertical scrolling with the mouse wheel.

### Inheritance Hierarchy

- [SparkSkinnableTextBase](#)
  - SparkTextArea

### Syntax

```
'Declaration
Public Class SparkTextArea _
Inherits SparkSkinnableTextBase
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>displayAsPassword</i>	whether the text field is a password text field. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>editable</i>	A flag indicating whether the user is allowed to edit the text in this control. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>enableIME</i>	A flag that indicates whether the IME should be enabled when the component receives focus. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>heightInLines</i>	The default height of the control, measured in lines.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>imeMode</i>	the IME (input method editor) mode. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableTextBase</i> )

Name	Description
<a href="#"><i>maxChars</i></a>	The maximum number of characters that the text field can contain, as entered by a user. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>maxWidth</i></a>	The maximum recommended width of the component to be considered by the parent during layout. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>mouseEnabled</i></a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>numAutomationChildren</i></a>	the number of automation children this container has. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>numColumns</i></a>	the total number of columns in the data available. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>numRows</i></a>	the total number of rows of data available. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>percentHeight</i></a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>percentWidth</i></a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>restrict</i></a>	the set of characters that a user can enter into the text field. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>scaleX</i></a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>scaleY</i></a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>selectable</i></a>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>selectionActivePosition</i></a>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>selectionAnchorPosition</i></a>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>selectionHighlighting</i></a>	a value whether the text selection is highlighted. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )

Name	Description
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">text</a>	The text String displayed by this component. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">widthInChars</a>	The default width of the control, measured in em units.
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Input</a>	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MouseScroll</a>	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectText</a>	Dispatched when text is selected. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SparkTextBase Class

## Description

The base class for Spark text controls such as Label and RichText which display text using CSS styles for the default format.

## Inheritance Hierarchy

- [FlexObject](#)
  - SparkTextBase
    - [SparkLabel](#)
    - [SparkRichText](#)

## Syntax

```
'Declaration  
Public Class SparkTextBase _  
Inherits FlexObject
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>isTruncated</i>	whether the text has been truncated.
<i>maxDisplayedLines</i>	An integer which determines whether, and where, the text gets truncated.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>text</i>	The text displayed by this text component.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Tostring</i></a>	Returns a string representation of the control. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>Type</i></a>	Dispatched when the user presses a key.
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTextInput Class

### Description

TextInput is a text-entry control that lets users enter and edit a single line of uniformly-formatted text.

### Inheritance Hierarchy

- [SparkSkinnableTextBase](#)
  - SparkTextInput

### Syntax

```
'Declaration
Public Class SparkTextInput _
Inherits SparkSkinnableTextBase
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">displayAsPassword</a>	whether the text field is a password text field. (Inherited from <a href="#">SparkSkinnableTextBase</a> )

Name	Description
<a href="#"><i>editable</i></a>	A flag indicating whether the user is allowed to edit the text in this control. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>enabled</i></a>	whether the component can accept user interaction. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>enableIME</i></a>	A flag that indicates whether the IME should be enabled when the component receives focus. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>errorColor</i></a>	the color of the component highlight when validation fails. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>errorString</i></a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>firstVisibleRow</i></a>	the index of the first visible child. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>focusEnabled</i></a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>height</i></a>	the height of the display object, in pixels. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>id</i></a>	the ID of the component. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>imeMode</i></a>	the IME (input method editor) mode. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>lastVisibleRow</i></a>	the index of the last visible child. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>maxChars</i></a>	The maximum number of characters that the text field can contain, as entered by a user. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>maxWidth</i></a>	The maximum recommended width of the component to be considered by the parent during layout. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>mouseEnabled</i></a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>numAutomationChildren</i></a>	the number of automation children this container has. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>numColumns</i></a>	the total number of columns in the data available. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>numRows</i></a>	the total number of rows of data available. (Inherited from <a href="#"><i>SparkSkinnableTextBase</i></a> )
<a href="#"><i>percentHeight</i></a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#"><i>FlexObject</i></a> )

Name	Description
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>restrict</i>	the set of characters that a user can enter into the text field. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>selectionHighlighting</i>	a value whether the text selection is highlighted. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>text</i>	The text String displayed by this component. (Inherited from <i>SparkSkinnableTextBase</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">widthInChars</a>	The default width of the control, measured in em units.
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Input</a>	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MouseScroll</a>	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectText</a>	Dispatched when text is selected. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkSkinnableTextBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTileGroup Class

### Description

The `TileGroup` container is an instance of the `Group` container that uses the `TileLayout` class.

### Inheritance Hierarchy

- [SparkGroup](#)
  - `SparkTileGroup`

### Syntax

```
'Declaration
Public Class SparkTileGroup _
Inherits SparkGroup
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">autoLayout</a>	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from <a href="#">SparkGroupBase</a> )

Name	Description
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>blendMode</i>	A value from the BlendMode class that specifies which blend mode to use. (Inherited from <i>SparkGroup</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>clipAndEnableScrolling</i>	a value whether to clip the children to the boundaries of the viewport. (Inherited from <i>SparkGroupBase</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkGroupBase</i> )
<i>contentHeight</i>	The height of the viewport's content. (Inherited from <i>SparkGroupBase</i> )
<i>contentWidth</i>	The width of the viewport's contents. (Inherited from <i>SparkGroupBase</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i> )
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i> )

Name	Description
<a href="#"><i>luminosityInvert</i></a>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>maskType</i></a>	The mask type. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>mouseEnabled</i></a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>mouseEnabledWhereTransparent</i></a>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>numAutomationChildren</i></a>	the number of automation children this container has. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>numColumns</i></a>	the total number of columns in the data available. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>numElements</i></a>	The number of visual elements in this container. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>numRows</i></a>	the total number of rows of data available. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>percentHeight</i></a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>percentWidth</i></a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>resizeMode</i></a>	The ResizeMode for this container. (Inherited from <a href="#"><i>SparkGroupBase</i></a> )
<a href="#"><i>scaleGridBottom</i></a>	the bottom coordinate of the scale grid. (Inherited from <a href="#"><i>SparkGroup</i></a> )
<a href="#"><i>scaleGridLeft</i></a>	the left coordinate of the scale grid. (Inherited from <a href="#"><i>SparkGroup</i></a> )
<a href="#"><i>scaleGridRight</i></a>	the right coordinate of the scale grid. (Inherited from <a href="#"><i>SparkGroup</i></a> )
<a href="#"><i>scaleGridTop</i></a>	the top coordinate of the scale grid. (Inherited from <a href="#"><i>SparkGroup</i></a> )
<a href="#"><i>scaleX</i></a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>scaleY</i></a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>tabChildren</i></a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )

Name	Description
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">verticalScrollPosition</a>	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MouseScroll</a>	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Scroll</a>	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkGroupBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTitleWindow Class

### Description

The `TitleWindow` class extends `Panel` to include a close button and move area.

## Inheritance Hierarchy

- [SparkPanel](#)
  - SparkTitleWindow

## Syntax

```
'Declaration  
Public Class SparkTitleWindow _  
Inherits SparkPanel
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">autoLayout</a>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">columnNames</a>	a list containing the names of all columns in the data. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">controlBarVisible</a>	a value whether the control bar is visible. (Inherited from <a href="#">SparkPanel</a> )
<a href="#">creationPolicy</a>	the content creation policy for this component. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">deferredContentCreated</a>	whether deferred content has been created. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">firstVisibleRow</a>	the index of the first visible child. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i> )
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>title</i>	the title or caption displayed in the title bar. (Inherited from <i>SparkPanel</i> )

Name	Description
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyle</i></a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>GetValues</i></a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkPanel</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkToggleButton Class

### Description

The `ToggleButton` component defines a toggle button. Clicking the button toggles it between the up and a down states.

### Inheritance Hierarchy

- [SparkToggleButtonBase](#)
  - `SparkToggleButton`
    - [SparkButtonBarButton](#)

### Syntax

```
'Declaration
Public Class SparkToggleButton _
Inherits SparkToggleButtonBase
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>autoRepeat</i>	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from <i>SparkButtonBase</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>label</i>	the text to appear on the ButtonBase control. (Inherited from <i>SparkButtonBase</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i> )
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	The event triggered when a drag operation is cancelled.
<a href="#">DragDrop</a>	The event triggered when the dragged item is dropped.
<a href="#">DragStart</a>	The event triggered when the drag/drop operation begins.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SparkToggleButtonBase Class

## Description

The `ToggleButtonBase` component is the base class for the Spark button components that support the selected property.

## Inheritance Hierarchy

- [SparkButtonBase](#)
  - SparkToggleButtonBase
    - [SparkCheckBox](#)
    - [SparkRadioButton](#)
    - [SparkToggleButton](#)

## Syntax

```
'Declaration
Public Class SparkToggleButtonBase _
Inherits SparkButtonBase
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">autoRepeat</a>	whether to dispatch repeated <code>buttonDown</code> events if the user holds down the mouse button. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">className</a>	the name of this instance's class, such as <code>Button</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">label</a>	the text to appear on the ButtonBase control. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">numAutomationChildren</a>	the number of automation children this container has. (Inherited from <a href="#">FlexObject</a> )
<a href="#">percentHeight</a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#">FlexObject</a> )
<a href="#">percentWidth</a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#">FlexObject</a> )
<a href="#">scaleX</a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">scaleY</a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">selected</a>	whether the button is in the down state, and false if it is in the up state.
<a href="#">stickyHighlighting</a>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyle</i></a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkButtonBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkTrackBase Class

### Description

The TrackBase class is a base class for components with a track and one or more thumb buttons, such as Slider and ScrollBar.

### Inheritance Hierarchy

- [SparkRange](#)
  - SparkTrackBase
    - [SparkScrollBar](#)
    - [SparkSlider](#)

### Syntax

```
'Declaration
Public Class SparkTrackBase _
Inherits SparkRange
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i> )
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i> )
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">value</a>	The current value for this range. (Inherited from <a href="#">SparkRange</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Change</a>	Dispatched when the value of the <code>NumericStepper</code> changes as a result of user interaction.
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkVideoDisplay Class

### Description

Identifies a Spark video display control.

### Inheritance Hierarchy

- [FlexObject](#)
  - SparkVideoDisplay

### Syntax

```
'Declaration
Public Class SparkVideoDisplay _
Inherits FlexObject
```

## Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i> )
<i>autoDisplayFirstFrame</i>	whether the video is loaded when the source is set.
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i> )
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>autoPlay</i>	whether the video starts playing immediately when the source property is set.
<i>autoRewind</i>	whether the FLV file should rewind to the first frame when play stops.
<i>bytesLoaded</i>	the number of bytes of data that have been downloaded into the application.
<i>bytesTotal</i>	the total size in bytes of the data being downloaded into the application.
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>currentTime</i>	the current time of the playhead, measured in seconds, since the video starting playing.
<i>duration</i>	the duration of the video's playback, in seconds.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>loop</i>	whether the media should play again after playback has completed.
<i>mediaPlayerState</i>	the current state of the video.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of

Name	Description
	this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>muted</i>	whether the video is muted.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>pauseWhenHidden</i>	whether the video continues to play when it is "hidden".
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>playing</i>	a value whether the video is playing or is attempting to play.
<i>scaleMode</i>	the different ways of sizing the video content.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i> )
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i> )
<i>volume</i>	the volume level, specified as a value between 0 and 1.
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkVideoPlayer Class

### Description

The VideoPlayer control is a skinnable video player that supports progressive download, multi-bitrate streaming, and streaming video.

### Inheritance Hierarchy

- [SparkObject](#)
  - SparkVideoPlayer

### Syntax

```
'Declaration
Public Class SparkVideoPlayer _
Inherits SparkObject
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">muted</a>	a value whether the control is muted.
<a href="#">numAutomationChildren</a>	the number of automation children this container has. (Inherited from <a href="#">FlexObject</a> )
<a href="#">percentHeight</a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#">FlexObject</a> )
<a href="#">percentWidth</a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#">FlexObject</a> )
<a href="#">playing</a>	a value if the video is playing or is attempting to play.
<a href="#">scaleX</a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">scaleY</a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">volume</a>	The volume level, specified as a value between 0 and 1.

Name	Description
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> ToString </a>	Returns a string representation of the control. (Inherited from <a href="#"> FlexDisplayObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkVolumeBar Class

### Description

The VolumeBar class defines a drop-down slider to control the volume of the VideoDisplay control.

### Inheritance Hierarchy

- [SparkSlider](#)
  - SparkVolumeBar

### Syntax

```
'Declaration
Public Class SparkVolumeBar _
Inherits SparkSlider
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>isDropDownOpen</i>	a value whether the volumebar is open.
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i> )
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i> )
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i> )
<i>muted</i>	a value whether the control is muted.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i> )
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i> )
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i> )
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i> )
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i> )
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i> )
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i> )
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i> )
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i> )
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i> )

Name	Description
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">value</a>	The current value for this range. (Inherited from <a href="#">SparkRange</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Change</a>	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">FlexObject</a> )
<a href="#">MuteChange</a>	Dispatched when the mute status changes as a result of user interaction.
<a href="#">Open</a>	Dispatched when the user clicks the drop-down button to display the drop-down list.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToString</a>	Returns a string representation of the control. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Type</a>	Dispatched when the user presses a key. (Inherited from <a href="#">SparkTrackBase</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkWindow Class

### Description

The Window is a top-level container for additional windows in an AIR desktop application.

### Inheritance Hierarchy

- [SparkSkinnableContainer](#)
  - SparkWindow

### Syntax

```
'Declaration
Public Class SparkWindow _
Inherits SparkSkinnableContainer _
Implements IMoveable
```

## Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">alwaysInFront</a>	a value whether the underlying NativeWindow is always in front of other windows.
<a href="#">autoLayout</a>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationIndex</a>	a string containing the automation index for the element. (Inherited from <a href="#">FlexObject</a> )
<a href="#">automationName</a>	the name that can be used as an identifier for this object. (Inherited from <a href="#">FlexObject</a> )
<a href="#">className</a>	the name of this instance's class, such as <i>Button</i> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">closed</a>	a value whether the underlying window has been closed.
<a href="#">columnNames</a>	a list containing the names of all columns in the data. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">creationPolicy</a>	the content creation policy for this component. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">currentState</a>	the current view state of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">deferredContentCreated</a>	whether deferred content has been created. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">enabled</a>	whether the component can accept user interaction. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorColor</a>	the color of the component highlight when validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">errorString</a>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <a href="#">FlexObject</a> )
<a href="#">firstVisibleRow</a>	the index of the first visible child. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">focusEnabled</a>	whether the component can receive focus when tabbed to. (Inherited from <a href="#">FlexObject</a> )
<a href="#">height</a>	the height of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">id</a>	the ID of the component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">isAIRWindow</a>	a value whether this window is an AIR window.
<a href="#">lastVisibleRow</a>	the index of the last visible child. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )

Name	Description
<a href="#">maxHeight</a>	The maximum recommended height of the component to be considered by the parent during layout.
<a href="#">maximizable</a>	a value whether the window can be maximized.
<a href="#">maxWidth</a>	The maximum recommended width of the component to be considered by the parent during layout.
<a href="#">minHeight</a>	The minimum recommended height of the component to be considered by the parent during layout.
<a href="#">minimizable</a>	a value whether the window can be minimized.
<a href="#">minWidth</a>	The minimum recommended width of the component to be considered by the parent during layout.
<a href="#">mouseEnabled</a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">numAutomationChildren</a>	the number of automation children this container has. (Inherited from <a href="#">FlexObject</a> )
<a href="#">numColumns</a>	the total number of columns in the data available. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">numElements</a>	The number of visual elements in this container. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">numRows</a>	the total number of rows of data available. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">percentHeight</a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#">FlexObject</a> )
<a href="#">percentWidth</a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#">FlexObject</a> )
<a href="#">resizable</a>	a value whether the window can be resized.
<a href="#">scaleX</a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">scaleY</a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#">FlexObject</a> )
<a href="#">showStatusBar</a>	a value whether the status bar is visible.
<a href="#">status</a>	The string that appears in the status bar, if it is visible.
<a href="#">systemChrome</a>	the type of system chrome (if any) the window has.
<a href="#">tabChildren</a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#">FlexDisplayObject</a> )

Name	Description
<a href="#">tabEnabled</a>	whether this object is in the tab order. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">tabIndex</a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">themeColor</a>	the theme color of a component. (Inherited from <a href="#">FlexObject</a> )
<a href="#">title</a>	The title that appears in the window title bar and the taskbar.
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">transparent</a>	a value whether the window is transparent.
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )
<a href="#">x</a>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DragCancel</a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragDrop</a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">DragStart</a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetStyle</a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">IMoveable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#"><i>SetFocus</i></a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Size</i></a>	Resizes the window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>StateChange</i></a>	Dispatched when the displaystatus of the window is changed.
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ToString</i></a>	Returns a string representation of the control. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SparkWindowedApplication Class

### Description

The WindowedApplication defines the application container that you use to create Flex applications for AIR applications.

### Inheritance Hierarchy

- [SparkApplication](#)
  - SparkWindowedApplication

### Syntax

```
'Declaration
Public Class SparkWindowedApplication _
Inherits SparkApplication _
Implements IMoveable
```

### Properties

Name	Description
<a href="#">alpha</a>	the alpha transparency value of the object specified. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">alwaysInFront</a>	a value whether the underlying NativeWindow is always in front of other windows.
<a href="#">applicationID</a>	The identifier that AIR uses to identify the application.
<a href="#">autoExit</a>	a value whether the AIR application will quit when the last window closes or will continue running in the background.
<a href="#">autoLayout</a>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <a href="#">SparkSkinnableContainer</a> )
<a href="#">automationClassName</a>	a string containing the automation class name for the element. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i> )
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i> )
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i> )
<i>closed</i>	a value whether the underlying window has been closed.
<i>colorCorrection</i>	The value of the stage's colorCorrection property. (Inherited from <i>SparkApplication</i> )
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>controlBarVisible</i>	whether the control bar is visible. (Inherited from <i>SparkApplication</i> )
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i> )
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i> )
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i> )
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i> )
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i> )
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i> )
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i> )
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i> )
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i> )
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i> )
<i>maxHeight</i>	The maximum recommended height of the component to be considered by the parent during layout.
<i>maximizable</i>	a value whether the window can be maximized.
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout.
<i>minHeight</i>	The minimum recommended height of the component to be considered by the parent during layout.

Name	Description
<a href="#"><i>minimizable</i></a>	a value whether the window can be minimized.
<a href="#"><i>minWidth</i></a>	The minimum recommended width of the component to be considered by the parent during layout.
<a href="#"><i>mouseEnabled</i></a>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>numAutomationChildren</i></a>	the number of automation children this container has. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>numColumns</i></a>	the total number of columns in the data available. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>numElements</i></a>	The number of visual elements in this container. (Inherited from <a href="#"><i>SparkSkinnableContainer</i></a> )
<a href="#"><i>numRows</i></a>	the total number of rows of data available. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>percentHeight</i></a>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>percentWidth</i></a>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>resizable</i></a>	a value whether the window can be resized.
<a href="#"><i>scaleX</i></a>	the number that specifies the horizontal scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>scaleY</i></a>	the number that specifies the vertical scaling factor. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>showStatusBar</i></a>	a value whether the status bar is visible.
<a href="#"><i>status</i></a>	The string that appears in the status bar, if it is visible.
<a href="#"><i>systemChrome</i></a>	the type of system chrome (if any) the window has.
<a href="#"><i>tabChildren</i></a>	whether the children of the display object are tab enabled. The default is true. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>tabEnabled</i></a>	whether this object is in the tab order. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>tabIndex</i></a>	the tab ordering of objects in a SWF file. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>themeColor</i></a>	the theme color of a component. (Inherited from <a href="#"><i>FlexObject</i></a> )
<a href="#"><i>title</i></a>	The title that appears in the window title bar and the taskbar.

Name	Description
<a href="#">toolTip</a>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <a href="#">FlexObject</a> )
<a href="#">transparent</a>	a value whether the window is transparent.
<a href="#">url</a>	The URL from which this Application's SWF file was loaded. (Inherited from <a href="#">SparkApplication</a> )
<a href="#">useHandCursor</a>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">viewSourceURL</a>	the URL where the application's source can be viewed. (Inherited from <a href="#">SparkApplication</a> )
<a href="#">visible</a>	whether the display object is visible. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">width</a>	the width of the display object, in pixels. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )
<a href="#">x</a>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )
<a href="#">y</a>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <a href="#">FlexDisplayObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeFocus</a>	Changes the current focus. (Inherited from <a href="#">FlexObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>DragCancel</i></a>	Dispatched when a drag operation is cancelled. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>DragDrop</i></a>	Dispatched when the dragged item is dropped. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>DragStart</i></a>	Dispatched when the drag/drop operation begins. (Inherited from <a href="#"><i>SparkSkinnableContainerBase</i></a> )
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetCloseWindows</i></a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetFocus</i></a>	Returns the object with the input focus. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetNextCloseWindow</i></a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyle</i></a>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <a href="#"><i>FlexDisplayObject</i></a> )

Name	Description
<a href="#">GetValues</a>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <a href="#">SparkSkinnableContainerBase</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <a href="#">IMoveable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <a href="#">FlexObject</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> Size </a>	Resizes the window. (Inherited from <a href="#"> IMoveable </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> ToString </a>	Returns a string representation of the control. (Inherited from <a href="#"> FlexDisplayObject </a> )
<a href="#"> Type </a>	Dispatched when the user presses a key. (Inherited from <a href="#"> SparkApplication </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Java SWT Class Reference

Lists the available classes for testing Java SWT controls.

### CBanner Class

#### Description

The class used to layout the toolbar area and perspective switching toolbar in the workbench.

#### Inheritance Hierarchy

- [Control](#)
  - CBanner

#### Syntax

```
'Declaration
Public Class CBanner _
Inherits Control
```

#### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Bottom</a>	The control located at the bottom of the banner.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Left</a>	The control located on the left side of the banner.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )

Name	Description
<a href="#">Right</a>	The control located on the right side of the banner.
<a href="#">RightMinimumSize</a>	The minimum size of the control located on the right side of the banner.
<a href="#">RightWidth</a>	The width of the control located on the right side of the banner.
<a href="#">Simple</a>	Whether the banner is rendered with a simple, traditional shape.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetHorizontalBar</i></a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## CoolBar Class

### Description

A container class that contains SWT widgets, primarily toolbars.

### Inheritance Hierarchy

- [Control](#)
  - CoolBar

### Syntax

```
'Declaration
Public Class CoolBar _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the coolbar.
<a href="#">Items</a>	A list of items in the coolbar.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# CoolItem Class

## Description

Contains selectable user interface objects that represent the areas of a CoolBar that can be dynamically positioned.

## Inheritance Hierarchy

- [Item](#)
  - CoolItem

## Syntax

```
'Declaration
Public Class CoolItem _
Inherits Item
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Content</a>	The content of the areas that can be dynamically positioned.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i> )
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )

## CtabFolder Class

### Description

Class for an enhanced tab folder, typically having decorated tabs and the minimize, maximize, and close buttons.

### Inheritance Hierarchy

- *Control*
  - CTabFolder

### Syntax

```
'Declaration
Public Class CTabFolder _
Inherits Control
```

### Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i> )

Name	Description
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the tab folder.
<a href="#">Items</a>	A list of items in the tab folder.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	The index of the selected item.
<a href="#">SelectedItem</a>	The selected tab item.
<a href="#">SelectedItemText</a>	The text of the selected item or an empty string if no item is selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the visible page.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Resizes the CTabFolder to its full (maximized) size.
<a href="#">Minimize</a>	Resizes the CTabFolder to the minimum size allowed.

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the CTabFolder to its previous size.
<a href="#">Select</a>	Selects an item from the CTabFolder.
<a href="#">SelectList</a>	Selects one or more items in the tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## CItem Class

### Description

The class for an enhanced tab within a CTabFolder.

### Inheritance Hierarchy

- [Item](#)
  - CItem

### Syntax

```
'Declaration
Public Class CItem _
Inherits Item
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )

Name	Description
<i>Font</i>	The font type of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Selected</i>	Whether the item is selected.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>Close</i>	Closes the visible tab.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects a tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ExpandBar Class

### Description

The class for widgets that expand and close by clicking on a header.

### Inheritance Hierarchy

- [Control](#)
  - ExpandBar

### Syntax

```
'Declaration
Public Class ExpandBar _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ExpandedItems</a>	A list of the items that are expanded.
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the expandbar.
<a href="#">Items</a>	A list of items in the expandbar.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Collapse</a>	Collapses the ExpandBar.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands an ExpandBar.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ExpandItem Class

### Description

The class that contains the expandable items in an `ExpandBar`.

## Inheritance Hierarchy

- [Item](#)
  - ExpandItem

## Syntax

```
'Declaration  
Public Class ExpandItem _  
Inherits Item
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Content</a>	The content of the item.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Expanded</a>	Whether the item is expanded.
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Collapse</a>	Collapses the expandable items.

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands the expandable items.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## HorizontalSash Class

### Description

The class for the horizontal border around a window pane that can be dragged to adjust the window size.

### Inheritance Hierarchy

- [Sash](#)
  - HorizontalSash

### Syntax

```
'Declaration
Public Class HorizontalSash _
Inherits Sash
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )

Name	Description
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window pane that the sash borders. (Inherited from <a href="#">Sash</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Sash Class

### Description

The class for the border around a window pane that can be dragged to adjust the window size.

### Inheritance Hierarchy

- [Control](#)
  - Sash
    - [HorizontalSash](#)
    - [VerticalSash](#)

### Syntax

```
'Declaration
Public Class Sash _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window pane that the sash borders.
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## SashForm Class

### Description

The class for the border around a form that can be dragged to adjust the size of the form.

## Inheritance Hierarchy

- [Control](#)
  - SashForm

## Syntax

```
'Declaration
Public Class SashForm _
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Horizontal</a>	Whether the sash form is horizontal.
<a href="#">MaximizedControl</a>	The sash window that is maximized in the form.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Vertical</a>	Whether the sash form is vertical.
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Weights</a>	The relative sizes of the children of the sash form window.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ScrollableControl Class

### Description

The implementation class for all controls which are only classified as controls but also contain a scrollbar.

### Inheritance Hierarchy

- [Control](#)
  - ScrollableControl

### Syntax

```
'Declaration
Public Class ScrollableControl _
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ScrolledComposite Class

### Description

The class for scrollbars and scrolls the content when the user uses the scrollbars.

### Inheritance Hierarchy

- [Control](#)
  - ScrolledComposite

### Syntax

```
'Declaration
Public Class ScrolledComposite _
Inherits Control
```

### Properties

Name	Description
<a href="#">AlwaysShowScrollBars</a>	Whether the scrollbar shows.
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Content</a>	The content of the areas that can be dynamically positioned.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Origin</a>	The point in the content that currently appears in the top left corner of the scrolled composite.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetVerticalBar</i></a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#"><i>IScrollable</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# Shell Class

## Description

The class for Java SWT windows.

## Inheritance Hierarchy

- [Window](#)
  - Shell

## Syntax

```
'Declaration  
Public Class Shell _  
Inherits Window
```

## Properties

Name	Description
<a href="#">Application</a>	The name of the Application that this Window belongs to. (Inherited from <a href="#">Window</a> )
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCloseWindows</a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetFocus</a>	Returns the object with the input focus. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetNextCloseWindow</a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )

Name	Description
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Spinner Class

### Description

The class to enter and modify numeric values for up/down controls.

### Inheritance Hierarchy

- [Control](#)
  - Spinner

### Syntax

```
'Declaration
Public Class Spinner _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">IncrementCount</a>	The amount to increase the position value of the spinner control after pressing it.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">PageSize</a>	The internal page size of the spinner control.
<a href="#">Position</a>	The position for the up/down control.
<a href="#">Range</a>	The range of the spinner control.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Decrement</a>	Decreases the value when the spinner controls are pressed.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Increment</a>	Increases the value when the spinner controls are pressed.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PageDecrement</a>	Decreases the value when the page spinner controls are pressed.
<a href="#">PageIncrement</a>	Increases the value when the page spinner controls are pressed.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> SetValue </a>	Sets the value for the spinner control.
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## StyledText Class

### Description

The class for an editable user interface object that displays lines of text.

### Inheritance Hierarchy

- [TextField](#)
  - [StyledText](#)

### Syntax

```
'Declaration
Public Class StyledText _
Inherits TextField
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Editable</a>	Whether the text is editable.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">IsPassword</a>	Whether the control is a password text field. (Inherited from <a href="#">TextField</a> )
<a href="#">MultiLine</a>	Whether the control is multiline. (Inherited from <a href="#">TextField</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Position</a>	The position of the caret within the text field. (Inherited from <a href="#">TextField</a> )
<a href="#">SelectedRange</a>	The selected range within the text field. (Inherited from <a href="#">TextField</a> )
<a href="#">SelectedText</a>	The selected text within the text field. An empty string if no text is selected. (Inherited from <a href="#">TextField</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearText</a>	Removes all text from the text field. (Inherited from <a href="#">TextField</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetMultiText</a>	Returns the specified lines of text in the multi-line text field. (Inherited from <a href="#">TextField</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#">SetMultiText</a>	Substitutes all or part of the lines in the multi-line text field. (Inherited from <a href="#">TextField</a> )
<a href="#">SetPosition</a>	Sets the insertion point in the text field. (Inherited from <a href="#">TextField</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionRange</a>	Selects the specified range of the single-line or multi-line text field. (Inherited from <a href="#">TextField</a> )
<a href="#">SetText</a>	Substitutes new text for all or part of the text in the text field. (Inherited from <a href="#">TextField</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTBrowser Class

### Description

The class for the browser widget.

### Inheritance Hierarchy

- [Control](#)
  - SWTBrowser

### Syntax

```
'Declaration
Public Class SWTBrowser _
Inherits Control
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# SWTDateTime Class

## Description

The class for SWT date and time elements in a calendar, date, or time control.

## Inheritance Hierarchy

- [Control](#)
  - SWTDateTime

## Syntax

```
'Declaration  
Public Class SWTDateTime _  
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">CurrentDate</a>	The current date.
<a href="#">Day</a>	The day.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Hours</a>	The hour.
<a href="#">Minutes</a>	The minute.
<a href="#">Month</a>	The month.
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Seconds</a>	The second.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Year</a>	The year.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects a date and time.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTTabControl Class

### Description

The class for SWT TabFolder.

## Inheritance Hierarchy

- [TabControl](#)
  - SWTTabControl

## Syntax

```
'Declaration
Public Class SWTTabControl _
Inherits TabControl
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the tab control. (Inherited from <a href="#">TabControl</a> )
<a href="#">Items</a>	A list of items in the tab control. (Inherited from <a href="#">TabControl</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	The index of the selected item. (Inherited from <a href="#">TabControl</a> )
<a href="#">SelectedItem</a>	The selected item. (Inherited from <a href="#">TabControl</a> )
<a href="#">SelectedTabItem</a>	The name of the selected item.
<a href="#">TabItems</a>	A list of TabItems in the tab control.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>BaseGuiTestObject</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Sets the current page to the specified page. (Inherited from <a href="#"><i>TabControl</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional

Name	Description
<a href="#">WaitForDisappearance</a>	<p>timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p> <p>Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">WaitForObject</a>	<p>Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. <a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects a tab.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<i>WaitForPropertyNotEquals</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<i>WaitForScreenshotStable</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTTable Class

### Description

The class for SWT tables.

### Inheritance Hierarchy

- [Table](#)
  - SWTTable

### Syntax

```
'Declaration
Public Class SWTTable _
Inherits Table
```

### Properties

Name	Description
<i>AllowsCheck</i>	Whether the control can display a checkmark. (Inherited from <a href="#">Table</a> )
<i>AllowsMultiSelect</i>	Whether the table supports selecting multiple items. (Inherited from <a href="#">Table</a> )
<i>Background</i>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<i>ColumnCount</i>	The number of columns in the table. (Inherited from <a href="#">Table</a> )
<i>ColumnItems</i>	A list of all items in the column. (Inherited from <a href="#">Table</a> )
<i>Enabled</i>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<i>Font</i>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )

Name	Description
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">RowCount</a>	The number of rows in the table. (Inherited from <a href="#">Table</a> )
<a href="#">RowItems</a>	A list of all table rows in the table. (Inherited from <a href="#">Table</a> )
<a href="#">SelectedIndices</a>	The indices of the selected item(s). (Inherited from <a href="#">Table</a> )
<a href="#">SelectedItems</a>	The selected item(s). (Inherited from <a href="#">Table</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box in the defined row of a table. (Inherited from <a href="#">Table</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleSelect</a>	Double-clicks an item. (Inherited from <a href="#">Table</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExtendSelectRow</a>	Selects a range of rows. (Inherited from <a href="#">Table</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FocusRow</a>	Focuses on a row in the table. (Inherited from <a href="#">Table</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MultiSelectRow</a>	Adds a row from the table to the set of selected rows. (Inherited from <a href="#">Table</a> )

Name	Description
<a href="#">MultiUnselectRow</a>	Removes a row from the set of selected rows. (Inherited from <a href="#">Table</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectRow</a>	Selects an row in the table. (Inherited from <a href="#">Table</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box in the defined row of a table. (Inherited from <a href="#">Table</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTTableColumn Class

### Description

The class for columns in an SWT table.

### Inheritance Hierarchy

- [TableColumn](#)
  - SWTTableColumn

### Syntax

```
'Declaration
Public Class SWTTableColumn _
Inherits TableColumn
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )

Name	Description
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Width</a>	The width of the column. (Inherited from <a href="#">TableColumn</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Resize</i></a>	Resizes a column. (Inherited from <a href="#"><i>TableColumn</i></a> )
<a href="#"><i>Select</i></a>	Selects a column. (Inherited from <a href="#"><i>TableColumn</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTTableRow Class

### Description

The class for rows in an SWT table.

### Inheritance Hierarchy

- [TableRow](#)
  - SWTTableRow

### Syntax

```
'Declaration
Public Class SWTTableRow _
Inherits TableRow
```

### Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Checked</a>	Whether the check box in the row is checked. (Inherited from <a href="#">TableRow</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the row. (Inherited from <a href="#">TableRow</a> )
<a href="#">Items</a>	A list of items in the row. (Inherited from <a href="#">TableRow</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SWTTree Class

### Description

The class for SWT tree widgets.

### Inheritance Hierarchy

- [Tree](#)
  - SWTTree

### Syntax

```
'Declaration
Public Class SWTTree _
Inherits Tree
```

## Properties

Name	Description
<a href="#">AllowsCheck</a>	Whether the control can display a checkmark. (Inherited from <a href="#">Tree</a> )
<a href="#">AllowsMultiSelect</a>	Whether the control supports selecting multiple items. (Inherited from <a href="#">Tree</a> )
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ColumnCount</a>	The number of columns in the tree.
<a href="#">Columns</a>	A list of columns in the tree.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">ItemCount</a>	The number of items in the tree (including all children). (Inherited from <a href="#">Tree</a> )
<a href="#">ItemPaths</a>	A list of items in the tree (including all children). (Inherited from <a href="#">Tree</a> )
<a href="#">Items</a>	A list of items in the tree (including all children). (Inherited from <a href="#">Tree</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	The index of the first selected item. (Inherited from <a href="#">Tree</a> )
<a href="#">SelectedIndices</a>	The indices of the selected item(s). (Inherited from <a href="#">Tree</a> )
<a href="#">SelectedItem</a>	The name of the first selected item. (Inherited from <a href="#">Tree</a> )
<a href="#">SelectedItems</a>	The names of the selected item(s). (Inherited from <a href="#">Tree</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">VisibleItemPaths</a>	A list of visible items in the tree (including all children). (Inherited from <a href="#">Tree</a> )
<a href="#">VisibleItems</a>	A list of visible items in the tree (including all children). (Inherited from <a href="#">Tree</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	<p>Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">Check</a>	Checks the check box. (Inherited from <a href="#">Tree</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Collapse</a>	Collapses an item in a treeview control. (Inherited from <a href="#">Tree</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks an item. (Inherited from <a href="#">Tree</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands an object in a treeview control. (Inherited from <a href="#">Tree</a> )
<a href="#">ExtendSelect</a>	Selects a range of items by extending the selection.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetContentsOfColumn</a>	Retrieves the contents of the specified column as a list. To retrieve the contents of any column greater than column one, you must specify the parameters <code>rawMode</code> and <code>column</code> .
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetItemPaths</a>	Returns all items of the tree as a list of itempaths (Inherited from <a href="#">Tree</a> )
<a href="#">GetItemRect</a>	Returns the size and position of an item relative to the treeview control. (Inherited from <a href="#">Tree</a> )
<a href="#">GetItemsOfColumn</a>	Retrieve items of the specified column from <code>Tree</code>

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetSelectedTextOfColumn</a>	Retrieves selected text from the specified column
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsExpandable</a>	Checks if the given item can be expanded. (Inherited from <a href="#">Tree</a> )
<a href="#">IsExpanded</a>	Checks if the given item is expanded. (Inherited from <a href="#">Tree</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MultiSelect</a>	Adds an item from the tree to the set of selected items.
<a href="#">MultiUnselect</a>	Removes an item in the tree from the set of selected items.
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects an item from the tree. (Inherited from <a href="#">Tree</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box. (Inherited from <a href="#">Tree</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
<i>WaitForPropertyNotEquals</i>	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )  Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )

## SWTTreeColumn Class

### Description

The class for columns in a Tree widget.

### Inheritance Hierarchy

- *Item*
  - SWTTreeColumn

### Syntax

```
'Declaration
Public Class SWTTreeColumn _
Inherits Item
```

### Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Enabled</i>	Whether the GUI object is enabled. (Inherited from <i>GuiTestObject</i> )
<i>Font</i>	The font type of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <i>GuiTestObject</i> )
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Width</a>	The width of the column.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Resize</i></a>	Resizes a column of the tree.
<a href="#"><i>Select</i></a>	Selects a tree column.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# VerticalSash Class

## Description

The class for the vertical border around a window pane that can be dragged to adjust the window size.

## Inheritance Hierarchy

- [Sash](#)
  - VerticalSash

## Syntax

```
'Declaration  
Public Class VerticalSash _  
Inherits Sash
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. <a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Move</a>	Moves the window pane that the sash borders. (Inherited from <a href="#">Sash</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<a href="#">WaitForObject</a>	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## ViewForm Class

### Description

The class to lay out a view's label/menu/toolbar local bar in the workbench.

### Inheritance Hierarchy

- [Control](#)
  - ViewForm

### Syntax

```
'Declaration
Public Class ViewForm _
Inherits Control
```

## Properties

Name	Description
<a href="#">Background</a>	The background color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Content</a>	The content of the areas that can be dynamically positioned.
<a href="#">Enabled</a>	Whether the GUI object is enabled. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Font</a>	The font type of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">Foreground</a>	The foreground color of the GUI object. (Inherited from <a href="#">GuiTestObject</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">TopCenter</a>	The window located in the top center of the pane.
<a href="#">TopLeft</a>	The window located in the top left of the pane.
<a href="#">TopRight</a>	The window located in the top right of the pane.
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Visible</a>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <a href="#">GuiTestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHorizontalBar</a>	Returns the horizontal scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVerticalBar</a>	Returns the vertical scroll bar for this control. (Inherited from <a href="#">IScrollable</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">BaseGuiTestObject</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Keyword-Driven Testing Class Reference

Lists the available classes for keyword-driven testing.

### ArgumentAttribute Class

#### Description

Used to explicitly specify the name of an argument of a method that is marked as a keyword for keyword-driven testing.

#### Syntax

```
<AttributeUsageAttribute(AttributeTargets.Parameter)>
Public Class ArgumentAttribute Inherits Attribute
```

#### Properties

Name	Description
<a href="#">Name Property (ArgumentAttribute)</a>	Gets the name of the argument.

#### Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments username and password:

```
<Keyword()>
Public Sub Login(<Argument("Name of the user")> username As
String, <Argument("Password of the user")> password As String)
' keyword implementation
End Sub
```

### Example: Using arguments without a description

Use one of the following code samples to create the keyword *Login* with the arguments *username* and *password*, without using a description for the arguments:

```
<Keyword()>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

```
<Keyword()>
Public Sub Login(<Argument> username As String, <Argument>
password As String)
    ' keyword implementation
End Sub
```

## KeywordAttribute Class

### Description

Specifies that a method is a keyword. If the name of the keyword is not specified the name of the annotated method is used as the keyword name.

### Syntax

```
'Declaration
<AttributeUsageAttribute(AttributeTargets.Method>
Public Class KeywordAttribute Inherits Attribute
```

### Properties

Name	Description
<a href="#">Name Property (KeywordAttribute)</a>	Gets the name of the keyword. The default value is an empty string.
<a href="#">Description Property (KeywordAttribute)</a>	Gets the description of the keyword. The default value is an empty string.

### Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments *username* and *password*:

```
<Keyword()>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

### Example: Specifying a keyword name

To specify the keyword name when creating a new keyword, use the following code sample:

```
<Keyword("Login user")>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

# KeywordGroupAttribute Class

## Description

Specifies that a class is a keyword group. Methods within this class that are marked as keywords are keywords. The qualified name of these methods consists of the name of the keyword group and the name of the keyword. If the keyword group has no name, the simple name of the declaring class is used instead.

## Syntax

```
'Declaration  
<AttributeUsageAttribute(AttributeTargets.Class)>  
Public Class KeywordGroupAttribute Inherits Attribute
```

## Properties

Name	Description
<a href="#">Name Property (KeywordGroupAttribute)</a>	Gets the name of the keyword group. The default value is an empty string.

### Example: Creating a keyword group

Use the following code sample to create the keyword group *LoginPage*:

```
<KeywordGroup()>  
Public Class LoginPage  
    ' keyword methods  
End Class
```

### Example: Specifying the name of the keyword group

Use one of the following code samples to create the keyword *Login* with the arguments *username* and *password*, without using a description for the arguments:

```
<KeywordGroup("Login Page")>  
Public Class LoginPage  
    ' keyword methods  
End Class
```

## Mobile Class Reference

Lists the available classes for testing Mobile controls.

## IMobileClickable Interface

### Description

Interface for objects that use clicks.

### Syntax

```
'Declaration  
Public Class IMobileClickable
```

## Methods

Name	Description
<a href="#">Click</a>	Clicks on the device at the specified coordinates.
<a href="#">DoubleClick</a>	Double-clicks on the device at the specified coordinates.
<a href="#">LongClick</a>	Long-clicks on the device at the specified coordinates.

# IMobileGestures Interface

## Description

Interface for objects that use long swipes.

## Syntax

```
'Declaration  
Public Class IMobileGestures
```

## Methods

Name	Description
<a href="#">Drag</a>	Performs a drag operation between the two specified points.
<a href="#">MultiTouch</a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time.
<a href="#">PinchIn</a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image.
<a href="#">PinchOut</a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image.
<a href="#">Swipe</a>	Performs a swipe between the two specified points.
<a href="#">SwipeDown</a>	Performs a down-swipe.
<a href="#">SwipeLeft</a>	Performs a left-swipe.
<a href="#">SwipeRight</a>	Performs a right-swipe.
<a href="#">SwipeUp</a>	Performs a up-swipe.
<a href="#">SwipeWithSegments</a>	Performs a swipe between the specified points.
<a href="#">TwoPointerMultiTouch</a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time.

# IMobileKeyable Interface

## Description

Interface for objects that use keystrokes.

## Syntax

```
'Declaration  
Public Class IMobileKeyable
```

## Methods

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object.

# MobileButton Class

## Description

Represents a mobile button. Mobile buttons can be clicked.

## Inheritance Hierarchy

- [MobileObject](#)
  - MobileButton

## Syntax

```
'Declaration
Public Class MobileButton _
Inherits MobileObject
```

## Properties

Name	Description
<a href="#">IsEnabled</a>	Whether the mobile object is enabled. (Inherited from <a href="#">MobileObject</a> )
<a href="#">IsFocused</a>	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from <a href="#">MobileObject</a> )
<a href="#">IsSelected</a>	Whether the mobile object is selected or checked. (Inherited from <a href="#">MobileObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )

Name	Description
<a href="#">Drag</a>	Performs a drag operation between the two specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">DragTo</a>	Drags this object to the specified point relative to the mobile device. (Inherited from <a href="#">MobileObject</a> )
<a href="#">DragToObject</a>	Drags this object to the specified destination object. (Inherited from <a href="#">MobileObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>LongClick</i></a>	Long-clicks on the device at the specified coordinates. (Inherited from <a href="#"><i>IMobileClickable</i></a> )
<a href="#"><i>MultiTouch</i></a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PinchIn</i></a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PinchOut</i></a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Swipe</i></a>	Performs a swipe between the two specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeDown</i></a>	Performs a down-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeLeft</i></a>	Performs a left-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeRight</i></a>	Performs a right-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeUp</i></a>	Performs a up-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeWithSegments</i></a>	Performs a swipe between the specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TwoPointerMultiTouch</i></a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IMobileKeyable</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## MobileDevice Class

### Description

The mobile device.

### Inheritance Hierarchy

- [TestObject](#)
  - MobileDevice

## Syntax

```
'Declaration
Public Class MobileDevice _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

## Properties

Name	Description
<a href="#">DeviceId</a>	The id of the device for the current connection.
<a href="#">DisplayHeight</a>	The height of the display in pixels.
<a href="#">DisplayOrientation</a>	The current orientation of the device.
<a href="#">DisplayWidth</a>	The width of the display in pixels.
<a href="#">IsEmulator</a>	Whether the connected device is an emulator.
<a href="#">Model</a>	The device name of the connected device.
<a href="#">OperatingSystem</a>	the operating system of the mobile device, Android or iOS
<a href="#">OsVersion</a>	The version of the operating system of the connected device.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">CloseApp</a>	Closes the app and releases the device, to make it available to other users.
<a href="#">DoubleClick</a>	Double-clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">Drag</a>	Performs a drag operation between the two specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateConnectionString</i></a>	Generates a connection string for this mobile device.
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>LongClick</i></a>	Long-clicks on the device at the specified coordinates. (Inherited from <a href="#"><i>IMobileClickable</i></a> )
<a href="#"><i>MultiTouch</i></a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )

Name	Description
<a href="#"><i>PinchIn</i></a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PinchOut</i></a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PressBack</i></a>	Presses the back button. This method is not supported on iOS.
<a href="#"><i>PressDelete</i></a>	Presses the delete button.
<a href="#"><i>PressEnter</i></a>	Presses the enter button.
<a href="#"><i>PressHome</i></a>	Presses the home button.
<a href="#"><i>PressKeyCode</i></a>	Presses a certain Android-specific key code. This method is not supported on iOS.
<a href="#"><i>PressRecentApps</i></a>	Presses the recent apps button.
<a href="#"><i>Rotate</i></a>	Simulates rotating the device screen.
<a href="#"><i>SetLocation</i></a>	Sets the geographic location of the device, this method only works on Android devices (physical or emulated) and iOS simulators.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Sleep</i></a>	Presses the power button if the screen is on. This method is not supported on iOS.
<a href="#"><i>Swipe</i></a>	Performs a swipe between the two specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeDown</i></a>	Performs a down-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeLeft</i></a>	Performs a left-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeRight</i></a>	Performs a right-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeUp</i></a>	Performs a up-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeWithSegments</i></a>	Performs a swipe between the specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TwoPointerMultiTouch</i></a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )

Name	Description
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IMobileKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WakeUp</a>	Presses the power button if the screen is off. This method is not supported on iOS.

## MobileObject Class

### Description

The base class for all mobile objects.

## Inheritance Hierarchy

- [TestObject](#)
  - MobileObject
    - [MobileButton](#)
    - [MobileTextField](#)
    - [MobileWindow](#)

## Syntax

```
'Declaration
Public Class MobileObject _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

## Properties

Name	Description
<a href="#">IsEnabled</a>	Whether the mobile object is enabled.
<a href="#">IsFocused</a>	Whether the mobile object has focus. This property is not supported on iOS.
<a href="#">IsSelected</a>	Whether the mobile object is selected or checked.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">Drag</a>	Performs a drag operation between the two specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">DragTo</a>	Drags this object to the specified point relative to the mobile device.
<a href="#">DragToObject</a>	Drags this object to the specified destination object.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>LongClick</i>	Long-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i> )

Name	Description
<a href="#">MultiTouch</a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">PinchIn</a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">PinchOut</a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">Swipe</a>	Performs a swipe between the two specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SwipeDown</a>	Performs a down-swipe. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SwipeLeft</a>	Performs a left-swipe. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SwipeRight</a>	Performs a right-swipe. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SwipeUp</a>	Performs a up-swipe. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">SwipeWithSegments</a>	Performs a swipe between the specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TwoPointerMultiTouch</a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IMobileKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## MobileTextField Class

### Description

Represents a text field.

### Inheritance Hierarchy

- [MobileObject](#)
  - MobileTextField

### Syntax

```
'Declaration
Public Class MobileTextField _
Inherits MobileObject
```

## Properties

Name	Description
<i>IsEnabled</i>	Whether the mobile object is enabled. (Inherited from <i>MobileObject</i> )
<i>IsFocused</i>	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from <i>MobileObject</i> )
<i>IsSelected</i>	Whether the mobile object is selected or checked. (Inherited from <i>MobileObject</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>ClearText</i>	Clears all the content from the text field.
<i>Click</i>	Clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i> )
<i>DoubleClick</i>	Double-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i> )
<i>Drag</i>	Performs a drag operation between the two specified points. (Inherited from <i>IMobileGestures</i> )
<i>DragTo</i>	Drags this object to the specified point relative to the mobile device. (Inherited from <i>MobileObject</i> )
<i>DragToObject</i>	Drags this object to the specified destination object. (Inherited from <i>MobileObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">LongClick</a>	Long-clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">MultiTouch</a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">PinchIn</a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">PinchOut</a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <a href="#">IMobileGestures</a> )

Name	Description
<a href="#"><i>setProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>setText</i></a>	Substitutes new text for the text in the text field.
<a href="#"><i>swipe</i></a>	Performs a swipe between the two specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>swipeDown</i></a>	Performs a down-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>swipeLeft</i></a>	Performs a left-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>swipeRight</i></a>	Performs a right-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>swipeUp</i></a>	Performs a up-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>swipeWithSegments</i></a>	Performs a swipe between the specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>textCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>textClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>textExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>textRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>twoPointerMultiTouch</i></a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>typeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IMobileKeyable</i></a> )
<a href="#"><i>typePasswordKeys</i></a>	Types an encrypted password into a text field.
<a href="#"><i>waitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>waitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>waitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>waitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>waitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## MobileWindow Class

### Description

The mobile window.

### Inheritance Hierarchy

- [MobileObject](#)
  - MobileWindow

### Syntax

```
'Declaration
Public Class MobileWindow _
Inherits MobileObject
```

### Properties

Name	Description
<a href="#">IsEnabled</a>	Whether the mobile object is enabled. (Inherited from <a href="#">MobileObject</a> )
<a href="#">IsFocused</a>	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from <a href="#">MobileObject</a> )
<a href="#">IsSelected</a>	Whether the mobile object is selected or checked. (Inherited from <a href="#">MobileObject</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks on the device at the specified coordinates. (Inherited from <a href="#">IMobileClickable</a> )
<a href="#">Drag</a>	Performs a drag operation between the two specified points. (Inherited from <a href="#">IMobileGestures</a> )
<a href="#">DragTo</a>	Drags this object to the specified point relative to the mobile device. (Inherited from <a href="#">MobileObject</a> )
<a href="#">DragToObject</a>	Drags this object to the specified destination object. (Inherited from <a href="#">MobileObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>LongClick</i></a>	Long-clicks on the device at the specified coordinates. (Inherited from <a href="#"><i>IMobileClickable</i></a> )
<a href="#"><i>MultiTouch</i></a>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PinchIn</i></a>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>PinchOut</i></a>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Swipe</i></a>	Performs a swipe between the two specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeDown</i></a>	Performs a down-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeLeft</i></a>	Performs a left-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeRight</i></a>	Performs a right-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>SwipeUp</i></a>	Performs a up-swipe. (Inherited from <a href="#"><i>IMobileGestures</i></a> )

Name	Description
<a href="#"><i>SwipeWithSegments</i></a>	Performs a swipe between the specified points. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TwoPointerMultiTouch</i></a>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <a href="#"><i>IMobileGestures</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IMobileKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Rumba Class Reference

Lists the available classes for testing Rumba controls.

## Rumba Keys

### Description

Contains the string constants for the Rumba key mnemonics which can be used in the `SendKeys` and `SynchSendKeys` methods of the `RumbaObject` class.

Includes the following string constants:

String Constant	Key Mnemonic
At	@@
Alt	@A
AltCursor	@e@1*
Attention	@A@Q
Backspace	@B
Backtab	@B
Clear	@C
Cmd	@A@Y
CursorDown	@V
CursorLeft	@L
CursorRight	@Z
CursorSelect	@e@1*
CursorUp	@U
Delete	@D
Dup	@S@x
End	@q
Enter	@E
EraseEof	@F
EraseEol	@e@d
EraseInput	@A@F

## String Constant

# RumbaCharacterAttribute Data Type

Represents the character attributes of an on-screen character.

Can include the following character attributes:

Attribute	Description
<code>backgroundColor</code>	The background color of the character.
<code>foregroundColor</code>	The foreground color of the character.
<code>column</code>	The column of the character on the screen.
<code>line</code>	The line of the character on the screen.
<code>autoEnter</code>	Defines if the character is part of an auto-enter text.
<code>autoSkip</code>	Defines if the character is part of an auto-skip text.
<code>blinking</code>	Defines if the character is blinking.
<code>bold</code>	Defines if the character is bold.
<code>columnSeparator</code>	Defines if the character is a column separator.
<code>detectable</code>	Defines if the character is part of a detectable text.
<code>hidden</code>	Defines if the character is part of a hidden text.
<code>protect</code>	Defines if the character is part of a protected text.
<code>reverseVideo</code>	Defines if the character is displayed in reverse video.
<code>underlined</code>	Defines if the character is underlined.

For additional information, see *IRDEAttribute Properties* in the Rumba Developer Edition (RDE) documentation.

## RumbaField Class

### Description

Represents a field on the green screen.

### Inheritance Hierarchy

- [RumbaObject](#)
  - RumbaField
    - [RumbaLabel](#)
    - [RumbaTextField](#)

### Syntax

```
'Declaration  
Public Class RumbaField _  
Inherits RumbaObject
```

## Properties

Name	Description
<a href="#">AutoEnter</a>	A value that indicates true if the field is an AutoEnter field.
<a href="#">AutoSkip</a>	A value that is true if the field is an AutoSkip field.
<a href="#">Detectable</a>	A value is indicates true if the field is detectable.
<a href="#">Dup</a>	A value that indicates true if the field is a dup field.
<a href="#">EndColumn</a>	A value that indicates the ending column of the field.
<a href="#">EndLine</a>	A value that indicates the ending line of the field.
<a href="#">EndPosition</a>	The 1-based end position of the field, when the screen is seen as one sequence of characters.
<a href="#">Enptui</a>	A value that indicates true if the field is an ENPTUI field.
<a href="#">FieldExitRequired</a>	A value that indicates true if the field is required before exiting the screen.
<a href="#">Hidden</a>	A value that indicates if the field is hidden.
<a href="#">Intense</a>	A value that indicates true if the field is intense.
<a href="#">Length</a>	The length of the field.
<a href="#">ModifiedDataTag</a>	A value that indicates true if the field has the ModifiedDataTag property set.
<a href="#">Protected</a>	A value that indicates true if the field is protected (i.e. a RumbaLabel).
<a href="#">StartColumn</a>	A value that indicates the column in which the field begins.
<a href="#">StartLine</a>	A value that indicates the line in which the field begins.
<a href="#">StartPosition</a>	The 1-based start position of the field, when the screen is seen as one sequence of characters.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Type</a>	A value that represents the input allowed for this field.
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCharacterAttributes</a>	Gets the character attributes for this field's characters.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SendKeys</i></a>	Sends keys. Supports RDE mnemonics. (Inherited from <a href="#"><i>RumbaObject</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SynchSendKeys</i></a>	Synchronously sends keys. Supports RDE mnemonics. (Inherited from <a href="#"><i>RumbaObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## RumbaLabel Class

### Description

A field in the screen whose text can be only be retrieved but not set.

### Inheritance Hierarchy

- [RumbaField](#)
  - RumbaLabel

### Syntax

```
'Declaration
Public Class RumbaLabel _
Inherits RumbaField
```

## Properties

Name	Description
<i>AutoEnter</i>	A value that indicates true if the field is an AutoEnter field. (Inherited from <i>RumbaField</i> )
<i>AutoSkip</i>	A value that is true if the field is an AutoSkip field. (Inherited from <i>RumbaField</i> )
<i>Detectable</i>	A value is indicates true if the field is detectable. (Inherited from <i>RumbaField</i> )
<i>Dup</i>	A value that indicates true if the field is a dup field. (Inherited from <i>RumbaField</i> )
<i>EndColumn</i>	A value that indicates the ending column of the field. (Inherited from <i>RumbaField</i> )
<i>EndLine</i>	A value that indicates the ending line of the field. (Inherited from <i>RumbaField</i> )
<i>EndPosition</i>	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from <i>RumbaField</i> )
<i>Enptui</i>	A value that indicates true if the field is an ENPTUI field. (Inherited from <i>RumbaField</i> )
<i>FieldExitRequired</i>	A value that indicates true if the field is required before exiting the screen. (Inherited from <i>RumbaField</i> )
<i>Hidden</i>	A value that indicates if the field is hidden. (Inherited from <i>RumbaField</i> )
<i>Intense</i>	A value that indicates true if the field is intense. (Inherited from <i>RumbaField</i> )
<i>Length</i>	The length of the field. (Inherited from <i>RumbaField</i> )
<i>ModifiedDataTag</i>	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from <i>RumbaField</i> )
<i>Protected</i>	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from <i>RumbaField</i> )
<i>StartColumn</i>	A value that indicates the column in which the field begins. (Inherited from <i>RumbaField</i> )
<i>StartLine</i>	A value that indicates the line in which the field begins. (Inherited from <i>RumbaField</i> )
<i>StartPosition</i>	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from <i>RumbaField</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Type</i>	A value that represents the input allowed for this field. (Inherited from <i>RumbaField</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCharacterAttributes</a>	Gets the character attributes for this field's characters. (Inherited from <a href="#">RumbaField</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SendKeys</a>	Sends keys. Supports RDE mnemonics. (Inherited from <a href="#">RumbaObject</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SynchSendKeys</a>	Synchronously sends keys. Supports RDE mnemonics. (Inherited from <a href="#">RumbaObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## RumbaObject Class

### Description

RumbaObject.

### Inheritance Hierarchy

- [TestObject](#)
  - RumbaObject

- [RumbaField](#)
- [RumbaScreen](#)

## Syntax

```
'Declaration
Public Class RumbaObject _
Inherits TestObject _
Implements IClickable, IFocusable, IKeyable
```

## Properties

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. <a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## RumbaScreen Class

### Description

Represents the whole green screen.

### Inheritance Hierarchy

- [RumbaObject](#)
  - RumbaScreen

### Syntax

```
'Declaration
Public Class RumbaScreen _
Inherits RumbaObject
```

### Properties

Name	Description
<a href="#">BackgroundColor</a>	the background color of the display control.
<a href="#">CharacterSetId</a>	a value that identifies the character set translation table used by the Display control.
<a href="#">ColumnCount</a>	a value that indicates the number of columns on the current screen.
<a href="#">CursorColumn</a>	the column position of the cursor on the screen.
<a href="#">CursorLine</a>	the line position of the cursor on the screen.
<a href="#">CursorPosition</a>	The current cursor position on the screen. Values are starting with 1 for the first line or column.
<a href="#">HostConnected</a>	a value that indicates if the host is connected.
<a href="#">HostDeviceName</a>	the host device name.
<a href="#">HostIpAddress</a>	the host IP address.
<a href="#">KeyboardLocked</a>	a value that indicates whether keyboard input is inhibited.
<a href="#">LineCount</a>	a value that indicates the number of lines on the current screen.
<a href="#">ScreenId</a>	the screen id.
<a href="#">ScreenSize</a>	the size of the screen in text lines and columns.
<a href="#">SessionName</a>	the session name.
<a href="#">SupportsStructuredFields</a>	a value that indicates if the host supports structured field decoding.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Clears the screen by sending the "clear" key. Equivalent to <code>synchSendKeys(RumbaKey.CLEAR)</code> .
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Connect</a>	Connects to the hosts in the current configuration.
<a href="#">Disconnect</a>	Disconnects the current connection.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCharacterAttributes</a>	Gets the character attributes for length-number of characters starting at the given position.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetContent</a>	Retrieves a string containing the screen without line breaks starting at the specified text position.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetLines</a>	Retrieves a clipping of the screen and returns the selected lines in a list of strings.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Reset</i></a>	Resets the screen by sending the "reset" key. Equivalent to <code>synchSendKeys(RumbaKey.RESET)</code> .
<a href="#"><i>SendKeys</i></a>	Sends keys. Supports RDE mnemonics. (Inherited from <a href="#"><i>RumbaObject</i></a> )
<a href="#"><i>SetCursorPosition</i></a>	Moves the cursor to the given position of the screen.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">Submit</a>	Submits the entered data to the server by sending the "submit" key. Equivalent to <code>synchSendKeys(RumbaKey.SUBMIT)</code> .
<a href="#">SynchSendKeys</a>	Synchronously sends keys. Supports RDE mnemonics. (Inherited from <a href="#">RumbaObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForHostConnected</a>	Waits until the session is connected.
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WriteText</a>	Writes text on the screen.

## RumbaTextField Class

### Description

A field in the screen whose text can be both retrieved and set.

### Inheritance Hierarchy

- [RumbaField](#)
  - RumbaTextField

### Syntax

```
'Declaration
Public Class RumbaTextField _
Inherits RumbaField
```

### Properties

Name	Description
<a href="#">AutoEnter</a>	A value that indicates true if the field is an AutoEnter field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">AutoSkip</a>	A value that is true if the field is an AutoSkip field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Detectable</a>	A value is indicates true if the field is detectable. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Dup</a>	A value that indicates true if the field is a dup field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">EndColumn</a>	A value that indicates the ending column of the field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">EndLine</a>	A value that indicates the ending line of the field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">EndPosition</a>	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Enptui</a>	A value that indicates true if the field is an ENPTUI field. (Inherited from <a href="#">RumbaField</a> )

Name	Description
<a href="#">FieldExitRequired</a>	A value that indicates true if the field is required before exiting the screen. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Hidden</a>	A value that indicates if the field is hidden. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Intense</a>	A value that indicates true if the field is intense. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Length</a>	The length of the field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">ModifiedDataTag</a>	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Protected</a>	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from <a href="#">RumbaField</a> )
<a href="#">StartColumn</a>	A value that indicates the column in which the field begins. (Inherited from <a href="#">RumbaField</a> )
<a href="#">StartLine</a>	A value that indicates the line in which the field begins. (Inherited from <a href="#">RumbaField</a> )
<a href="#">StartPosition</a>	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Type</a>	A value that represents the input allowed for this field. (Inherited from <a href="#">RumbaField</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCharacterAttributes</a>	Gets the character attributes for this field's characters. (Inherited from <a href="#">RumbaField</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SendKeys</a>	Sends keys. Supports RDE mnemonics. (Inherited from <a href="#">RumbaObject</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetText</a>	Sets the text field's text.
<a href="#">SynchSendKeys</a>	Synchronously sends keys. Supports RDE mnemonics. (Inherited from <a href="#">RumbaObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
<a href="#">WaitForObject</a>	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SAP Class Reference

Lists the available classes for testing SAP controls.

### ISapContextMenuable Interface

#### Description

Interface for any Component which supports ContextMenu selections.

#### Syntax

```
'Declaration
Public Class ISapContextMenuable
```

#### Methods

Name	Description
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu.
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item.
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus.

# SapBarChart Class

## Description

Class for SAP Bar Chart.

## Inheritance Hierarchy

- [SapShell](#)
  - SapBarChart

## Syntax

```
'Declaration  
Public Class SapBarChart _  
Inherits SapShell _  
Implements ISapContextMenuable
```

## Properties

Name	Description
<a href="#">AccessibilityDescription</a>	the accessibility description of the shell.
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ChartCount</a>	the number of charts.
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )
<i>WindowHandle</i>	the window handle of the control that is connected to the GuiShell.

## Methods

Name	Description
<i>BarCount</i>	Returns the number of bars in the given chart.
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetBarContent</i>	Returns the content of the bar.

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetGridLineContent</a>	Returns the content of the grid line.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GridCount</a>	Returns the number of grids within the chart.
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">LinkCount</a>	Returns the number of links within the given chart.
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SendData</a>	Send data to the server.

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapBox Class

### Description

Class for SAP SapBox.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapBox

### Syntax

```
'Declaration
Public Class SapBox _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapButton Class

### Description

`SapButton` class is the class for push buttons.

### Inheritance Hierarchy

- [SapComponent](#)
  - `SapButton`

### Syntax

```
'Declaration
Public Class SapButton _
Inherits SapComponent
```

## Properties

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i> )
<i>CharHeight</i>	the height of the element in character metric.
<i>CharLeft</i>	the left coordinate of the element in character metric.
<i>CharTop</i>	the top coordinate of the element in character metric.
<i>CharWidth</i>	the width of the element in character metric.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i> )
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i> )
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i> )
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i> )
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Select</a>	This emulates manually pressing a button. Pressing a button will always cause server communication to occur, rendering all references to elements below the window level invalid.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#"><i>WaitForObject</i></a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## SapCalendar Class

### Description

SapCalendar class represents a SapCalendar.

### Inheritance Hierarchy

- [\*SapShell\*](#)
  - SapCalendar

### Syntax

```
'Declaration
Public Class SapCalendar _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#"><i>AccessibilityText</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTextOnRequest</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTooltip</i></a>	an additional tooltip text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Changeable</i></a>	whether an object is changeable. (Inherited from <a href="#"><i>SapComponent</i></a> )

Name	Description
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>Day</i>	The day of the month that is currently selected.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i> )
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i> )
<i>EndSelection</i>	The end of the selection interval.
<i>FirstVisibleDate</i>	the earliest date visible in the calendar control.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i> )
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i> )
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i> )
<i>LastVisibleDate</i>	the last date visible in the calendar control.
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Month</i>	The month of the year that is currently selected.
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>SelectionInterval</i>	The interval that is currently selected.
<i>StartSelection</i>	The start of the selection interval.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Week</i>	The week of the year that is currently selected.
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )
<i>Year</i>	The year that is currently selected.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ContextMenu</a>	Opens a context menu.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SetFirstVisibleDate</a>	Sets the earliest date visible in the calendar control.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocusDate</a>	Sets the date to be focused.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectionInterval</a>	Selects the specified interval.
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapChart Class

### Description

Class for SAP Chart.

### Inheritance Hierarchy

- [SapShell](#)
  - SapChart

### Syntax

```
'Declaration
Public Class SapChart _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityDescription</a>	the accessibility description of the shell.

Name	Description
<a href="#"><i>AccessibilityText</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTextOnRequest</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTooltip</i></a>	an additional tooltip text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Changeable</i></a>	whether an object is changeable. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>CurrentContextMenu</i></a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#"><i>DefaultTooltip</i></a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>DragDropSupported</i></a>	whether the shell allows drag and drop operations. (Inherited from <a href="#"><i>SapShell</i></a> )
<a href="#"><i>Height</i></a>	the current height of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IconName</i></a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IsSymbolFont</i></a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Left</i></a>	the left position of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Modified</i></a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Name</i></a>	the name of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenLeft</i></a>	the left position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenTop</i></a>	the top position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Tooltip</i></a>	the tooltip text. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Top</i></a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Value</i></a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Width</i></a>	the current width of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>WindowHandle</i></a>	the window handle of the control that is connected to the GuiShell.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SelectContextMenuItem</i></a>	Select an item from the controls context menu. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByPosition</i></a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByText</i></a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ValueChange</i></a>	Changes a value of the chart.
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapCheckBox Class

### Description

SapCheckBox class is the class for check box controls.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapCheckBox

### Syntax

```
'Declaration
Public Class SapCheckBox _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#"><i>AccessibilityTooltip</i></a>	an additional tooltip text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Changeable</i></a>	whether an object is changeable. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>CharHeight</i></a>	the height of the element in character metric.
<a href="#"><i>CharLeft</i></a>	the left coordinate of the element in character metric.
<a href="#"><i>CharTop</i></a>	the top coordinate of the element in character metric.
<a href="#"><i>CharWidth</i></a>	the width of the element in character metric.
<a href="#"><i>Checked</i></a>	whether the checkbox is checked.
<a href="#"><i>ColorIndex</i></a>	the index of the list color of this element.
<a href="#"><i>ColorIntensified</i></a>	whether the Intensified flag is set in screen painter for this element.
<a href="#"><i>ColorInverse</i></a>	whether the inverse color style is set in screen painter for the element.
<a href="#"><i>DefaultTooltip</i></a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Flushing</i></a>	whether the value change causes a round trip.
<a href="#"><i>Height</i></a>	the current height of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IconName</i></a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IsLeftLabel</i></a>	whether the component has the 'assign left' flag.
<a href="#"><i>IsListElement</i></a>	whether the element is on an ABAP list, not a screen.
<a href="#"><i>IsRightLabel</i></a>	whether the component has the 'assign right' flag.
<a href="#"><i>IsSymbolFont</i></a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Left</i></a>	the left position of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Modified</i></a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Name</i></a>	the name of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>RowText</i></a>	the text of the while line containing the current component.
<a href="#"><i>ScreenLeft</i></a>	the left position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenTop</i></a>	the top position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Tooltip</i></a>	the tooltip text. (Inherited from <a href="#"><i>SapComponent</i></a> )

Name	Description
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Uncheck</a>	Un-checks the check box.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapColorSelector Class

### Description

SapColorSelector class represents a SapColorSelector.

### Inheritance Hierarchy

- [SapShell](#)
  - SapColorSelector

### Syntax

```
'Declaration
Public Class SapColorSelector _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	<p>Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>ChangeSelection</i>	<p>Selects the color at the given index position.</p>
<i>Exists</i>	<p>Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)</p>
<i>Exists</i>	<p>Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)</p>
<i>Find</i>	<p>Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>FindAll</i>	<p>Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>GenerateLocator</i>	<p>Returns a locator for this object. (Inherited from <i>TestObject</i>)</p>
<i>GetChildren</i>	<p>Returns the child objects of this object. (Inherited from <i>TestObject</i>)</p>
<i>GetDynamicMethodList</i>	<p>Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i>. (Inherited from <i>TestObject</i>)</p>
<i>GetParent</i>	<p>Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)</p>
<i>GetProperty</i>	<p>Returns the value of the specified property. (Inherited from <i>TestObject</i>)</p>
<i>GetPropertyList</i>	<p>Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)</p>
<i>GetRect</i>	<p>Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)</p>
<i>HighlightObject</i>	<p>Highlights this object. (Inherited from <i>TestObject</i>)</p>
<i>ImageClick</i>	<p>Clicks on specified image asset. (Inherited from <i>TestObject</i>)</p>
<i>ImageClickFile</i>	<p>Clicks on the specified image. (Inherited from <i>TestObject</i>)</p>
<i>ImageExists</i>	<p>Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageExistsFile</i>	<p>Returns whether the specified image exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageRectangle</i>	<p>Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)</p>

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapComboBox Class

### Description

Class for SAP ComboBox.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapComboBox

### Syntax

```
'Declaration
Public Class SapComboBox _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<i>CharHeight</i>	the height of the element in character metric.
<i>CharLeft</i>	the left coordinate of the element in character metric.
<i>CharTop</i>	the top coordinate of the element in character metric.
<i>CharWidth</i>	the width of the element in character metric.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<i>Flushing</i>	whether the value change causes a round trip.
<i>Height</i>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<i>IsLeftLabel</i>	whether the component has the 'assign left' flag.
<i>IsListBoxActive</i>	whether the list box of the the combo box is currently open.
<i>IsRightLabel</i>	whether the component has the 'assign right' flag.
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<i>Key</i>	the key of the currently selected item.
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<i>Name</i>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<i>Required</i>	whether the component is a required value for the screen.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<i>Text</i>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<i>Tooltip</i>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<i>Width</i>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCurrentEntryKey</a>	the key of the current entry.
<a href="#">GetCurrentEntryValue</a>	the value of the current entry.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetEntryKeys</a>	a list of all entry keys.
<a href="#">GetEntryValues</a>	a list of all entry values.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectItem</a>	Selects the specified item.
<a href="#">SelectKey</a>	Selects the list item with the specified key.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapComponent Class

### Description

SapComponent class is the base class for SAP.

### Inheritance Hierarchy

- [TestObject](#)
  - SapComponent
    - [SapBox](#)
    - [SapButton](#)
    - [SapCheckBox](#)
    - [SapComboBox](#)
    - [SapContainer](#)

## Syntax

```
'Declaration
Public Class SapComponent _
Inherits TestObject _
Implements IFocusable
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support.
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support.
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support.
<a href="#">Changeable</a>	whether an object is changeable.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type.
<a href="#">Height</a>	the current height of the component.
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string.
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font.
<a href="#">Left</a>	the left position of the element in screen coordinates.
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system.
<a href="#">Name</a>	the name of the component.
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates.
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text.
<a href="#">Top</a>	the top coordinate of the element in screen coordinates.
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Width</a>	the current width of the component.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#"><i>WaitForObject</i></a>	increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

## SapContainer Class

### Description

Class for SAP Container.

### Inheritance Hierarchy

- [\*SapComponent\*](#)
  - SapContainer

### Syntax

```
'Declaration
Public Class SapContainer _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#"><i>AccessibilityText</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTextOnRequest</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTooltip</i></a>	an additional tooltip text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Changeable</i></a>	whether an object is changeable. (Inherited from <a href="#"><i>SapComponent</i></a> )

Name	Description
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is

Name	Description
	200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapContainerShell Class

### Description

Class for SAP ContainerShell.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapContainerShell

### Syntax

```
'Declaration
Public Class SapContainerShell _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapContextMenu Class

### Description

The class for SAP context menus.

For information on determining the items of a SAP context menu, see [Determining the item names and item texts of a SapContextMenu](#).

### Inheritance Hierarchy

- [SapMenu](#)
  - SapContextMenu

## Syntax

```
'Declaration  
Public Class SapContextMenu _  
Inherits SapMenu
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Select</a>	Select the menu. (Inherited from <a href="#">SapMenu</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapCustomControl Class

### Description

Class for SAP CustomControl.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapCustomControl

### Syntax

```
'Declaration
Public Class SapCustomControl _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapGridView Class

### Description

Class for SAP GridView. Some of the methods that have Get as a prefix require the column as an input parameter of type string. This parameter is different for each individual GridView element. To obtain the value of this parameter, record an action on the desired item and use the parameter that you have recorded.

### Inheritance Hierarchy

- [SapShell](#)
  - SapGridView

### Syntax

```
'Declaration
Public Class SapGridView _
Inherits SapShell _
Implements ISapContextMenuable
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ColumnCount</a>	the number of columns.
<a href="#">ColumnOrder</a>	a list of strings which contains all the column identifiers in the order in which they are displayed.
<a href="#">CurrentCellColumn</a>	the current column.
<a href="#">CurrentCellRow</a>	the current row.
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">FirstVisibleColumn</a>	the first visible column of the scrollable area of the grid view, fixed columns are ignored.
<a href="#">FirstVisibleRow</a>	the index of the first visible row in the grid.
<a href="#">FrozenColumnCount</a>	the number of columns that are excluded from horizontal scrolling.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">RowCount</a>	the number of rows.
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">SelectedCells</a>	a list of strings that contains the selected cells, each of which has the format "<row>,<column id>".
<a href="#">SelectedColumns</a>	a list of strings of currently selected columns.
<a href="#">SelectedRows</a>	a comma separated list of row index numbers or index ranges, such as "1,4,6-8".
<a href="#">SelectionMode</a>	the selection mode. Possible values are: "RowsAndColumns", "ListboxSingle", "ListboxMultiple", "Free".
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Title</a>	the title of the grid control.
<a href="#">ToolbarButtonCount</a>	the number of tool bar buttons (separators included).
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VisibleRowCount</a>	the number of visible rows of the grid view.
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ClearSelection</a>	Removes all row, column and cell selections.
<a href="#">Click</a>	Clicks on the specified cell.
<a href="#">ClickCurrentCell</a>	Clicks the current cell.
<a href="#">ContextMenu</a>	Requests the context menu.
<a href="#">CurrentCellMoved</a>	This function notifies the server that another cell was made the current cell. The function must be called whenever the current cell changes.
<a href="#">DeleteRows</a>	Delete the given rows.
<a href="#">DeselectColumn</a>	Removes the specified column from the list of selected columns.
<a href="#">DoubleClick</a>	Double clicks the specified cell.

Name	Description
<a href="#"><i>DoubleClickCurrentCell</i></a>	Double clicks on the current cell.
<a href="#"><i>DuplicateRows</i></a>	Duplicates the given range of rows
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetCellColor</i></a>	Returns an identifier for the color of the cell.
<a href="#"><i>GetCellHeight</i></a>	Gets the height of the cell in pixels.
<a href="#"><i>GetCellIcon</i></a>	Gets the icon string of the specified cell.
<a href="#"><i>GetCellLeft</i></a>	Gets the left position of the cell.
<a href="#"><i>GetCellMaxLength</i></a>	Gets the maximum length of the cell in number of bytes.
<a href="#"><i>GetCellState</i></a>	Gets the state of the specified cell. Possible values are: Normal, Error, Warning, Info.
<a href="#"><i>GetCellTooltip</i></a>	Gets the tooltip of the specified cell.
<a href="#"><i>GetCellTop</i></a>	Gets the top position of the specified cell.
<a href="#"><i>GetCellType</i></a>	Gets the cell type of the specified cell.
<a href="#"><i>GetCellValue</i></a>	Gets the value of the specified cell.
<a href="#"><i>GetCellWidth</i></a>	Gets the width of the specified cell.
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetColorInfo</i></a>	Returns the description for the color of the cell.
<a href="#"><i>GetColumnDataType</i></a>	Gets the data type of the column.
<a href="#"><i>GetColumnPosition</i></a>	Gets the position of the specified column.
<a href="#"><i>GetColumnSortType</i></a>	Gets the sort type of the column. Possible values are: None, Ascending, Descending.
<a href="#"><i>GetColumnTitles</i></a>	Gets all column titles of the specified column.
<a href="#"><i>GetColumnTooltip</i></a>	Gets the tool tip text of the specified column.
<a href="#"><i>GetColumnTotalType</i></a>	Gets the total type of the column. Possible values are: None, Total, Subtotal.
<a href="#"><i>GetDisplayedColumnName</i></a>	Gets the currently displayed title of the specified column.

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRowTotalLevel</i></a>	Gets the level of the row.
<a href="#"><i>GetSymbolInfo</i></a>	Returns the description for the symbol in the cell.
<a href="#"><i>GetToolBarButtonIcon</i></a>	Gets the name of the icon of the specified toolbar button.
<a href="#"><i>GetToolBarButtonId</i></a>	Gets the ID of the specified tool bar button.
<a href="#"><i>GetToolBarButtonText</i></a>	Gets the text of the specified tool bar button.
<a href="#"><i>GetToolBarButtonTooltip</i></a>	Gets the tooltip of the specified tool bar button
<a href="#"><i>GetToolBarButtonType</i></a>	Gets the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox".
<a href="#"><i>GetToolBarFocusButton</i></a>	Gets the position of the current focused tool bar button
<a href="#"><i>HasCellF4Help</i></a>	Returns true if the specified cell has a value help assigned.
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InsertRows</i></a>	Inserts a range of rows
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsCellChangeable</i></a>	Returns true if the specified cell is changeable.

Name	Description
<a href="#"><i>IsCellCheckBoxChecked</i></a>	Returns true if the check box at the specified position is checked.
<a href="#"><i>IsCellHotspot</i></a>	Returns true if the cell is a link.
<a href="#"><i>IsCellSymbol</i></a>	Returns true if the text in the cell is displayed in the SAP symbol font.
<a href="#"><i>IsCellTotalExpander</i></a>	Returns true if the specified cell contains a total expander button.
<a href="#"><i>IsColumnFiltered</i></a>	Returns true if the specified column is filtered.
<a href="#"><i>IsColumnKey</i></a>	Returns true if the specified column is a key column.
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>IsToolbarButtonChecked</i></a>	Returns true if the specified tool bar button is checked.
<a href="#"><i>IsToolbarButtonEnabled</i></a>	Returns true if the specified button is enabled.
<a href="#"><i>IsTotalRowExpanded</i></a>	whether the specified total row is expanded.
<a href="#"><i>ModifyCell</i></a>	Modifies the value of the specified cell.
<a href="#"><i>ModifyCheckBox</i></a>	Modifies the value of the specified checkbox cell.
<a href="#"><i>MoveRows</i></a>	Moves the rows with an index greater than or equal to fromRow up to an index less than or equal to toRow to the position of destRow.
<a href="#"><i>PressButton</i></a>	Presses the button placed in the specified cell.
<a href="#"><i>PressButtonCurrentCell</i></a>	Clicks a button placed in the current cell.
<a href="#"><i>PressColumnHeader</i></a>	Clicks on the header of the specified column.
<a href="#"><i>PressEnter</i></a>	Presses the enter key.
<a href="#"><i>PressF1</i></a>	Presses the F1 key.
<a href="#"><i>PressF4</i></a>	Presses the F4 key.
<a href="#"><i>PressToolbarButton</i></a>	Clicks the specified button in the grid view's tool bar.
<a href="#"><i>PressToolbarContextButton</i></a>	Opens the context menu of the specified button of the grid view's tool bar.
<a href="#"><i>PressTotalRow</i></a>	Presses the row button of the specified total row.
<a href="#"><i>PressTotalRowCurrentCell</i></a>	Presses the expansion button on the current cell.
<a href="#"><i>SelectAll</i></a>	Selects the whole grid content (i.e. all rows and all columns).
<a href="#"><i>SelectColumn</i></a>	Adds the specified column to the list of the selected columns.
<a href="#"><i>SelectContextMenuItem</i></a>	Select an item from the controls context menu. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByPosition</i></a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByText</i></a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectionChanged</i></a>	Notifies the server that the selection has changed
<a href="#"><i>SelectToolbarMenuItem</i></a>	Selects an item from the context menu of the grid view's tool bar.

Name	Description
<a href="#">SetColumnOrder</a>	Sets the order of the columns.
<a href="#">SetColumnWidth</a>	Sets the width of the specified column.
<a href="#">SetCurrentCell</a>	Sets the specified cell as the current cell.
<a href="#">SetCurrentCellColumn</a>	Specifies the column of the current cell.
<a href="#">SetCurrentCellRow</a>	Sets the row of the current cell.
<a href="#">SetFirstVisibleColumn</a>	Sets the first visible column.
<a href="#">SetFirstVisibleRow</a>	Sets the first visible row.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectedRows</a>	Selects the specified rows.
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TriggerModified</a>	Notifies the server of multiple changes in cells. Typically this method should be called after multiple calls to <a href="#">ModifyCell</a> .
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <a href="#">WaitForObject</a> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <a href="#">WaitForObject</a> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapHorizontalScrollBar Class

### Description

Class for horizontal scrollbars.

### Inheritance Hierarchy

- [SapScrollbar](#)
  - SapHorizontalScrollBar

### Syntax

```
'Declaration
Public Class SapHorizontalScrollBar _
Inherits SapScrollbar
```

### Properties

Name	Description
<a href="#">Maximum</a>	the maximum scrollbar value. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Minimum</a>	the minimum scrollbar value. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">PageSize</a>	the scrollbar pagesize. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Position</a>	the current scrollbar position. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ScrollTo</i></a>	Scrolls to the given position. (Inherited from <a href="#"><i>SapScrollbar</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapHTMLViewer Class

### Description

Class for SAP HTMLView.

### Inheritance Hierarchy

- [SapShell](#)
  - SapHTMLViewer

### Syntax

```
'Declaration
Public Class SapHTMLViewer _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DocumentComplete</a>	whether the document is complete.

Name	Description
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">WindowHandle</a>	the window handle of the control that is connected to the GuiShell.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ContextMenu</a>	Emulates the context menu request. Applies only to context menus provided by the backend.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )
<i>SapEvent</i>	This function submits an HTML form to the backend.

Name	Description
<a href="#"><i>SelectContextMenuItem</i></a>	Select an item from the controls context menu. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByPosition</i></a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByText</i></a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapLabel Class

### Description

SapLabel class is the class for all SAP labels.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapLabel

### Syntax

```
'Declaration
Public Class SapLabel _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CharLeft</a>	the left coordinate of the label in character metric.
<a href="#">CharTop</a>	the top coordinate of the label in character metric.
<a href="#">CharWidth</a>	the width of the element in character metric.
<a href="#">ColorIndex</a>	the color index of the label.
<a href="#">ColorInverse</a>	whether the inverse color style is set for the label.

Name	Description
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DisplayedText</a>	the text of the label.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Highlighted</a>	whether the label has the 'highlighted' flag assigned.
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsHotspot</a>	whether a mouse click on the label causes a round trip.
<a href="#">IsLeftLabel</a>	whether the component has the 'assign left' flag assigned.
<a href="#">IsListElement</a>	whether the element is on an ABAP list.
<a href="#">IsRightLabel</a>	whether the component has the 'assign right' flag assigned.
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Maxlength</a>	the maximum text length of the label in code units.
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Numerical</a>	whether the label may only contain numbers.
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>Exists</i>	<p>Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)</p>
<i>Exists</i>	<p>Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)</p>
<i>Find</i>	<p>Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>FindAll</i>	<p>Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>GenerateLocator</i>	<p>Returns a locator for this object. (Inherited from <i>TestObject</i>)</p>
<i>GetChildren</i>	<p>Returns the child objects of this object. (Inherited from <i>TestObject</i>)</p>
<i>GetDynamicMethodList</i>	<p>Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i>. (Inherited from <i>TestObject</i>)</p>
<i>GetParent</i>	<p>Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)</p>
<i>GetProperty</i>	<p>Returns the value of the specified property. (Inherited from <i>TestObject</i>)</p>
<i>GetPropertyList</i>	<p>Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)</p>
<i>GetRect</i>	<p>Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)</p>
<i>HighlightObject</i>	<p>Highlights this object. (Inherited from <i>TestObject</i>)</p>
<i>ImageClick</i>	<p>Clicks on specified image asset. (Inherited from <i>TestObject</i>)</p>
<i>ImageClickFile</i>	<p>Clicks on the specified image. (Inherited from <i>TestObject</i>)</p>
<i>ImageExists</i>	<p>Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageExistsFile</i>	<p>Returns whether the specified image exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageRectangle</i>	<p>Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)</p>

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapMenu Class

### Description

Class for SAP Menu.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapMenu
    - [SapContextMenu](#)

### Syntax

```
'Declaration
Public Class SapMenu _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Select</a>	Select the menu.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SapMenubar Class

## Description

Class for SAP MenuBar.

## Inheritance Hierarchy

- [SapComponent](#)
  - SapMenubar

## Syntax

```
'Declaration  
Public Class SapMenubar _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapNetPlan Class

### Description

Class for SAP Net Chart.

### Inheritance Hierarchy

- [SapShell](#)
  - SapNetPlan

### Syntax

```
'Declaration
Public Class SapNetPlan _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityDescription</a>	the accessibility description of the shell.

Name	Description
<a href="#"><i>AccessibilityText</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTextOnRequest</i></a>	an additional text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>AccessibilityTooltip</i></a>	an additional tooltip text for accessibility support. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Changeable</i></a>	whether an object is changeable. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>CurrentContextMenu</i></a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#"><i>DefaultTooltip</i></a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>DragDropSupported</i></a>	whether the shell allows drag and drop operations. (Inherited from <a href="#"><i>SapShell</i></a> )
<a href="#"><i>Height</i></a>	the current height of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IconName</i></a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IsSymbolFont</i></a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Left</i></a>	the left position of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>LinkCount</i></a>	the number of links in the net.
<a href="#"><i>Modified</i></a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Name</i></a>	the name of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>NodeCount</i></a>	the number of Nodes in the net.
<a href="#"><i>ScreenLeft</i></a>	the left position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenTop</i></a>	the top position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Tooltip</i></a>	the tooltip text. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Top</i></a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Value</i></a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Width</i></a>	the current width of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>WindowHandle</i></a>	the window handle of the control that is connected to the GuiShell.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetLinkContent</a>	Returns the content of the link.
<a href="#">GetNodeContent</a>	Returns the content of the node.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SelectContextMenuItem</i></a>	Select an item from the controls context menu. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByPosition</i></a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByText</i></a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SendData</i></a>	This function emulates the output of each action triggered at the control side. The result of the action is sent to the server.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapOfficeIntegration Class

### Description

Class for SAP OfficeIntegration.

### Inheritance Hierarchy

- [SapShell](#)
  - SapOfficeIntegration

### Syntax

```
'Declaration
Public Class SapOfficeIntegration _
Inherits SapShell _
Implements ISapContextMenuable
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapOkCodeField Class

### Description

`SapOkCodeField` class is the class for sap `OkCodeField`.

### Inheritance Hierarchy

- [SapComponent](#)
  - `SapOkCodeField`

### Syntax

```
'Declaration
Public Class SapOkCodeField _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Opened</a>	whether the GuiOkCodeField is collapsed.
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<i>Close</i>	Collapses the GuiOkCodeField.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>Open</i></a>	Expands the GuiOkCodeField.
<a href="#"><i>PressF1</i></a>	Emulate pressing the F1 key while the focus is on the GuiOkCodeField.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetText</i></a>	Sets the text of the control to the specified text.
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapPicture Class

### Description

Class for SAP picture.

### Inheritance Hierarchy

- [SapShell](#)
  - SapPicture

### Syntax

```
'Declaration
Public Class SapPicture _
Inherits SapShell _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DisplayMode</a>	the display mode of the picture, i.e. "Normal", "Stretch", "Fit", "NormalCenter", "FitCenter"

Name	Description
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Icon</a>	the SAPGUI icon code e.g. ("@01@")
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Url</a>	the URL of the picture
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	clicks on a picture
<a href="#">ClickControlArea</a>	clicks on the specified position

Name	Description
<a href="#">ClickPictureArea</a>	clicks on the specified position in the picture area
<a href="#">ContextMenu</a>	The function opens a context menu on the given position. The coordinates should be given in pixels with respect to the picture control as it is displayed on the screen.
<a href="#">DoubleClick</a>	double clicks on the picture
<a href="#">DoubleClickControlArea</a>	double clicks on the specified position
<a href="#">DoubleClickPictureArea</a>	double clicks on the specified position in the picture area
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
<a href="#">WaitForObject</a>	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapRadioButton Class

### Description

SapRadioButton class is the class for radio button controls.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapRadioButton

### Syntax

```
'Declaration
Public Class SapRadioButton _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">CharHeight</a>	the height of the element in character metric
<a href="#">CharLeft</a>	the left coordinate of the element in character metric
<a href="#">CharTop</a>	the top coordinate of the element in character metric
<a href="#">CharWidth</a>	the width of the element in character metric
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Flushing</a>	whether the value change causes a round trip
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsLeftLabel</a>	whether the component has the 'assign left' flag
<a href="#">IsRightLabel</a>	whether the component has the 'assign right' flag
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Selected</a>	whether the radio button is selected
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>Exists</i>	<p>Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)</p>
<i>Exists</i>	<p>Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)</p>
<i>Find</i>	<p>Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>FindAll</i>	<p>Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)</p>
<i>GenerateLocator</i>	<p>Returns a locator for this object. (Inherited from <i>TestObject</i>)</p>
<i>GetChildren</i>	<p>Returns the child objects of this object. (Inherited from <i>TestObject</i>)</p>
<i>GetDynamicMethodList</i>	<p>Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i>. (Inherited from <i>TestObject</i>)</p>
<i>GetParent</i>	<p>Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)</p>
<i>GetProperty</i>	<p>Returns the value of the specified property. (Inherited from <i>TestObject</i>)</p>
<i>GetPropertyList</i>	<p>Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)</p>
<i>GetRect</i>	<p>Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)</p>
<i>HighlightObject</i>	<p>Highlights this object. (Inherited from <i>TestObject</i>)</p>
<i>ImageClick</i>	<p>Clicks on specified image asset. (Inherited from <i>TestObject</i>)</p>
<i>ImageClickFile</i>	<p>Clicks on the specified image. (Inherited from <i>TestObject</i>)</p>
<i>ImageExists</i>	<p>Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageExistsFile</i>	<p>Returns whether the specified image exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageRectangle</i>	<p>Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)</p>

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Select</a>	Selects the radio button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<i>WaitForPropertyNotEquals</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )  Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i> )

## SapScrollbar Class

### Description

Class for SAP Scrollbar.

### Inheritance Hierarchy

- *TestObject*
  - SapScrollbar
    - *SapHorizontalScrollBar*
    - *SapVerticalScrollBar*

### Syntax

```
'Declaration
Public Class SapScrollbar _
Inherits TestObject
```

### Properties

Name	Description
<i>Maximum</i>	the maximum scrollbar value.
<i>Minimum</i>	the minimum scrollbar value.
<i>PageSize</i>	the scrollbar pagesize.
<i>Position</i>	the current scrollbar position.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">ScrollTo</a>	Scrolls to the given position.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapScrollContainer Class

### Description

Class for SAP UserArea.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapScrollContainer

### Syntax

```
'Declaration
Public Class SapScrollContainer _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapShell Class

### Description

Class for SAP SapShell.

## Inheritance Hierarchy

- [SapComponent](#)
  - SapShell
    - [SapBarChart](#)
    - [SapCalendar](#)
    - [SapChart](#)
    - [SapColorSelector](#)
    - [SapGridView](#)

    - [SapToolbarControl](#)
    - [SapTree](#)

## Syntax

```
'Declaration  
Public Class SapShell _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapSimpleContainer Class

### Description

Class for SAP SimpleContainer.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapSimpleContainer

## Syntax

```
'Declaration  
Public Class SapSimpleContainer _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. ## SapSplitterContainer Class

### Description

Class for SAP splitter container.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapSplitterContainer

### Syntax

```
'Declaration
Public Class SapSplitterContainer _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. # SapStatusbar Class

## Description

Class for SAP statusbar.

## Inheritance Hierarchy

- [SapComponent](#)
  - SapStatusbar

## Syntax

```
'Declaration  
Public Class SapStatusbar _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">MessageId</a>	the name of the message class used in the ABAP message call
<a href="#">MessageNumber</a>	the message number used in the ABAP message call
<a href="#">MessageType</a>	the type of the displayed message in the statusbar, i.e. S (Success), W (Warning), E (Error), A (Abort), I (Information)
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">DoubleClick</a>	double-clicks the statusbar
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTab Class

### Description

Class for SAP Tab.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapTab

### Syntax

```
'Declaration
Public Class SapTab _
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">Select</a>	Selects the tab
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTable Class

### Description

SapTable class is the class for SAP tables.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapTable

### Syntax

```
'Declaration
Public Class SapTable _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CharHeight</a>	the height of the element in character metric.
<a href="#">CharLeft</a>	the left coordinate of the element in character metric.
<a href="#">CharTop</a>	the top coordinate of the element in character metric.
<a href="#">CharWidth</a>	the width of the element in character metric.
<a href="#">ColumnCount</a>	the number of columns in the table.
<a href="#">ColumnSelectionMode</a>	the column selection mode

Name	Description
<i>CurrentColumn</i>	the index of the current column.
<i>CurrentRow</i>	the index of the current row.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i> )
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i> )
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i> )
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i> )
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>RowCount</i>	the number of rows in the table including invisible rows.
<i>RowSelectionMode</i>	the row selection mode.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>TableFieldName</i>	the table field name.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>VisibleRowCount</i>	the number of visible rows in the table.
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ConfigureLayout</a>	Opens the configuration layout dialog, in which the layout of the table can be changed.
<a href="#">DeselectAllColumns</a>	This function can be used for table controls with a button that allows to de-select all columns in one step.
<a href="#">DeselectColumn</a>	Deselects the given column.
<a href="#">DeselectRow</a>	Deselects the given row.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetCell</a>	Returns a visible table cell.
<a href="#">GetCellAbsolute</a>	Returns a table cell. If the row is not visible, it will be scrolled into view.
<a href="#">GetCellsForRow</a>	Returns the cells for the given row.
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetColumnName</a>	This method returns the title of the given column.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetVisibleCellsForColumn</a>	Returns the visible cells for the given column.

Name	Description
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsColumnSelected</a>	Returns true if the given column is selected.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsRowSelected</a>	Returns true if the given row is selected.
<a href="#">ReorderTable</a>	This method re-orders the columns.
<a href="#">SelectAllColumns</a>	This function can be used for table controls with a button that allows to select all columns in one step.
<a href="#">SelectColumn</a>	Selects the given column.
<a href="#">SelectRow</a>	Selects the given row.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTabStrip Class

### Description

Class for SAP tab pane.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapTabStrip

## Syntax

```
'Declaration  
Public Class SapTabStrip _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">SelectedTab</a>	the current selected tab.
<a href="#">Tabs</a>	all tabs of the tab pane.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTextEdit Class

### Description

Class for SAP TextEdit.

### Inheritance Hierarchy

- [SapShell](#)
  - SapTextEdit

### Syntax

```
'Declaration
Public Class SapTextEdit _
Inherits SapShell
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentColumn</a>	the column index in which the caret is currently positioned.
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">CurrentLine</a>	the line index in which the caret is currently positioned.

Name	Description
<a href="#"><i>DefaultTooltip</i></a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>DragDropSupported</i></a>	whether the shell allows drag and drop operations. (Inherited from <a href="#"><i>SapShell</i></a> )
<a href="#"><i>FirstVisibleLine</i></a>	the first visible line which is visualized at the top border of the text edit control.
<a href="#"><i>Height</i></a>	the current height of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IconName</i></a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>IsSymbolFont</i></a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>LastVisibleLine</i></a>	the last visible line which is visualized at the bottom border of the text edit control.
<a href="#"><i>Left</i></a>	the left position of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>LineCount</i></a>	the number of all lines in the text edit control.
<a href="#"><i>Modified</i></a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Name</i></a>	the name of the component. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenLeft</i></a>	the left position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>ScreenTop</i></a>	the top position of the component in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>SelectedText</i></a>	the currently selected text.
<a href="#"><i>SelectionEndColumn</i></a>	the column index in which the selection ends.
<a href="#"><i>SelectionEndLine</i></a>	the line index in which the selection ends.
<a href="#"><i>SelectionIndexEnd</i></a>	the overall end index of the text selection.
<a href="#"><i>SelectionIndexStart</i></a>	the overall start index of the text selection.
<a href="#"><i>SelectionStartColumn</i></a>	the column start index of the text selection.
<a href="#"><i>SelectionStartLine</i></a>	the line index in which the selection starts.
<a href="#"><i>Text</i></a>	The text of the control. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Tooltip</i></a>	the tooltip text. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Top</i></a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>Value</i></a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ContextMenu</a>	Requests the context menu.
<a href="#">DoubleClick</a>	Double clicks the text edit control.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetLineText</a>	Returns the text of the specified line.
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsBreakpointLine</i></a>	whether the specified line contains a breakpoint.
<a href="#"><i>IsCommentLine</i></a>	Returns true if the specified line is a comment line.
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>IsHighlightedLine</i></a>	Returns true if the specified line is highlighted.
<a href="#"><i>IsProtectedLine</i></a>	Returns true if the specified line is protected.
<a href="#"><i>PressF1</i></a>	Presses the F1 key.
<a href="#"><i>PressF4</i></a>	Presses the F4 key.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetSelectionIndexes</i></a>	Selects the text within the specified range.
<a href="#"><i>SetText</i></a>	Sets the specified text in the text edit control.
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTextField Class

### Description

SapTextField is the class for single-line and multi-line fields whose text can be modified by the user.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapTextField

## Syntax

```
'Declaration  
Public Class SapTextField _  
Inherits SapComponent
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DisplayedText</a>	the text as it is displayed on the screen, including preceding or trailing blanks.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsPassword</a>	whether the text field is a password text field.
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetPasswordText</i></a>	Sends an encrypted password to the object.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetText</i></a>	Sets the text of the control to the specified text.
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <a href="#"><i>WaitForObject</i></a> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTitlebar Class

### Description

Class for SAP Titlebar.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapTitlebar

### Syntax

```
'Declaration
Public Class SapTitlebar _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )

Name	Description
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapToolbar Class

### Description

Class for SAP Toolbar.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapToolbar

### Syntax

```
'Declaration
Public Class SapToolbar _
Inherits SapComponent
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ShowContextMenu</i></a>	Shows the context menu of the control. (Inherited from <a href="#"><i>SapComponent</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapToolBarControl Class

### Description

Class for SAP ToolbarControl.

### Inheritance Hierarchy

- [SapShell](#)
  - SapToolBarControl

### Syntax

```
'Declaration
Public Class SapToolBarControl _
Inherits SapShell _
Implements ISapContextMenuable
```

## Properties

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i> )
<i>ButtonCount</i>	the number of toolbar buttons including separators.
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i> )
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i> )
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i> )
<i>FocusedButton</i>	the zero-based index of the button that currently has the focus.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i> )
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i> )
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i> )
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i> )
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i> )
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i> )
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i> )

Name	Description
<a href="#">WindowHandle</a>	the window handle of the control that is connected to the GuiShell.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetButtonIcon</a>	the name of the icon of the specified toolbar button.
<a href="#">GetButtonType</a>	the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox"
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsButtonChecked</a>	if the button is currently checked (pressed).
<a href="#">IsButtonEnabled</a>	if the button can be pressed.
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">PressContextButton</a>	Press the context button with the given id.
<a href="#">SelectButton</a>	emulates pressing the button with the given id.
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectMenuItem</a>	emulates selecting the menu item with the given id.
<a href="#">SelectMenuItemByText</a>	emulates selecting the menu item by menu item text.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapTree Class

### Description

SapTree class is the class for all SAP trees. Some of the methods that have Get as a prefix require the nodeKey and the ItemName as input parameters of type string. These parameters are different for each individual SapTree element. To obtain the value of these parameters, record an action on the desired item and use the parameters that you have recorded.

## Inheritance Hierarchy

- [SapShell](#)
  - SapTree

## Syntax

```
'Declaration  
Public Class SapTree _  
Inherits SapShell _  
Implements ISapContextMenuable
```

## Properties

Name	Description
<a href="#">AccessibilityDescription</a>	the accessibility description of the shell.
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ColumnHeaders</a>	a collection of the titles of the columns.
<a href="#">ColumnNames</a>	a collection of the column names.
<a href="#">ColumnOrder</a>	the column order.
<a href="#">ColumnTitles</a>	a collection of the titles of the columns.
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DragDropSupported</a>	whether the shell allows drag and drop operations. (Inherited from <a href="#">SapShell</a> )
<a href="#">FocusedNodeKey</a>	the key of the focused node.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">HierarchyHeaderWidth</a>	the width of the hierarchy header in pixels.
<a href="#">HierarchyTitle</a>	the hierarchy title.
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">NodeKeys</a>	a collection containing either the node key of the root node, or the node keys of all nodes in the tree, depending on the application.
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">SelectedItemColumn</a>	the key of the currently selected item column.
<a href="#">SelectedItemNode</a>	the key of the currently selected item node.
<a href="#">SelectedNode</a>	the key of the currently selected node.
<a href="#">SelectedNodes</a>	a collection containing the node keys of all the selected nodes in the tree.
<a href="#">SelectionMode</a>	the selection mode.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TopNode</a>	the key of the top node.
<a href="#">TreeType</a>	the tree type. (simple tree, list tree or column tree)
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">ChangeCheckbox</a>	This method emulates changing a checkbox state.
<a href="#">CollapseNode</a>	This function closes the node with the key nodeKey.

Name	Description
<a href="#">DefaultContextMenu</a>	This method requests a context menu for the whole Tree Control.
<a href="#">DoubleSelectedItem</a>	This function emulates double clicking on a text item.
<a href="#">DoubleSelectNode</a>	This function emulates double clicking a node.
<a href="#">EnsureVisibleHorizontalItem</a>	This function scrolls the Tree horizontally until the Item is visible.
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">ExpandNode</a>	This function expands the node with the key nodeKey.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindNodeKeyByPath</a>	Return the node key for the given path (e.g. 2\1\2).
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetAbapImage</a>	Gets the abap image.
<a href="#">GetCheckBoxState</a>	Retrieves the CheckBox state (true = Checked, false = Unchecked).
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetColumnIndexFromName</a>	Gets the column index for the given name.
<a href="#">GetColumnKeys</a>	The keys of all the items in the given column.
<a href="#">GetColumnTitleFromName</a>	Gets the column title for the given name.
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetHierarchyLevel</a>	Gets the hierarchy level for the given key.
<a href="#">GetItemHeight</a>	Returns the current item height.
<a href="#">GetItemLeft</a>	The left position of the component.
<a href="#">GetItemStyle</a>	The style of the given item.
<a href="#">GetItemText</a>	For multi column trees, this function returns the text of the item specified by the key and name parameters.
<a href="#">GetItemTextColor</a>	Returns the item text color.
<a href="#">GetItemTooltip</a>	Returns the item tooltip text.
<a href="#">GetItemTop</a>	The top position of the component.
<a href="#">GetItemType</a>	Returns the type of the given node.

Name	Description
<a href="#"><i>GetItemWidth</i></a>	Returns the current item width.
<a href="#"><i>GetListTreeNodeItemCount</i></a>	Returns the node item count.
<a href="#"><i>GetNextNodeKey</i></a>	Returns the key of the next node.
<a href="#"><i>GetNodeAbapImage</i></a>	Returns the abap image for the given node.
<a href="#"><i>GetNodeChildrenCount</i></a>	This function returns the number of children of the node given.
<a href="#"><i>GetNodeChildrenCountByPath</i></a>	This function returns the number of children of the node given by the path parameter (e.g. 2\1\2).
<a href="#"><i>GetNodeHeight</i></a>	The current height of the node.
<a href="#"><i>GetNodeIndex</i></a>	The index of the given node.
<a href="#"><i>GetNodeItemHeaders</i></a>	Returns the headers for the given node.
<a href="#"><i>GetNodeLeft</i></a>	The left position of the component.
<a href="#"><i>GetNodePathByKey</i></a>	Given a node key, the path is retrieved (e.g. 2\1\2).
<a href="#"><i>GetNodeStyle</i></a>	Returns the style of the node.
<a href="#"><i>GetNodeText</i></a>	This function returns the text of the node specified by the given key.
<a href="#"><i>GetNodeTextByPath</i></a>	The text of a node defined by the given path is returned.
<a href="#"><i>GetNodeTextColor</i></a>	Returns the node text color.
<a href="#"><i>GetNodeTooltip</i></a>	Returns the node tooltip text.
<a href="#"><i>GetNodeTop</i></a>	The top position of the component.
<a href="#"><i>GetNodeWidth</i></a>	Returns the current node width.
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParentNodeKey</i></a>	Key of the parent node of the node specified by the given key.
<a href="#"><i>GetPreviousNodeKey</i></a>	Key of the previous node of the node specified by the given key.
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetStyleDescription</i></a>	Returns the description for the given style.
<a href="#"><i>GetSubNodesKeys</i></a>	Collection of the keys of all subnodes of the node specified by the given key.
<a href="#"><i>HeaderContextMenu</i></a>	This method requests a context menu for a header.
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>IsFolder</i></a>	Whether the given node is a folder.
<a href="#"><i>IsFolderExpandable</i></a>	Whether the folder is expandable.
<a href="#"><i>IsFolderExpanded</i></a>	Whether the folder is expanded.
<a href="#"><i>IsHighLighted</i></a>	Whether the node is highlighted.
<a href="#"><i>ItemContextMenu</i></a>	This method requests a context menu for an item.
<a href="#"><i>NodeContextMenu</i></a>	This method requests a context menu for a node.
<a href="#"><i>PressKey</i></a>	This method emulates pressing a key.
<a href="#"><i>SelectButton</i></a>	This method emulates pressing a button.
<a href="#"><i>SelectColumn</i></a>	This function adds a column to the column selection. A node or item selection is removed.
<a href="#"><i>SelectContextMenuItem</i></a>	Select an item from the controls context menu. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByPosition</i></a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectContextMenuItemByText</i></a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#"><i>ISapContextMenuable</i></a> )
<a href="#"><i>SelectHeader</i></a>	This method emulates clicking a header.
<a href="#"><i>SelectItem</i></a>	This function emulates the selection of an item. This selection removes all other selections.
<a href="#"><i>SelectLink</i></a>	This function emulates triggering a link.
<a href="#"><i>SelectNode</i></a>	The node with the key <code>nodeKey</code> is added to the Node Selection.
<a href="#"><i>SetCheckBoxState</i></a>	Changes the state of the checkbox in the given node.
<a href="#"><i>SetColumnOrder</i></a>	Sets the order of the tree's column.
<a href="#"><i>SetColumnWidth</i></a>	This function sets the width of a column in pixels.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">SetHierarchyHeaderWidth</a>	Sets the width of the Hierarchy Header in pixels.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelectedNode</a>	Select the given node.
<a href="#">SetTopNode</a>	Sets the given key as top node.
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">UnselectAll</a>	All selections are removed.
<a href="#">UnselectColumn</a>	This function removes a column from the column selection.
<a href="#">UnselectNode</a>	The node with the key nodeKey is removed from the Node Selection.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapUserArea Class

### Description

Class for SAP UserArea.

### Inheritance Hierarchy

- [SapComponent](#)
  - SapUserArea

### Syntax

```
'Declaration
Public Class SapUserArea _
Inherits SapComponent _
Implements ISapContextMenuable
```

### Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">CurrentContextMenu</a>	The current context menu. This is only set when a context menu is available at the shell object.
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SelectContextMenuItem</a>	Select an item from the controls context menu. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByPosition</a>	This method allows you to select a context menu item using the position of the item. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SelectContextMenuItemByText</a>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <a href="#">ISapContextMenuable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SapVerticalScrollBar Class

### Description

Class for vertical scrollbars.

### Inheritance Hierarchy

- [SapScrollbar](#)
  - SapVerticalScrollBar

### Syntax

```
'Declaration
Public Class SapVerticalScrollBar _
Inherits SapScrollbar
```

### Properties

Name	Description
<a href="#">Maximum</a>	the maximum scrollbar value. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Minimum</a>	the minimum scrollbar value. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">PageSize</a>	the scrollbar pagesize. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Position</a>	the current scrollbar position. (Inherited from <a href="#">SapScrollbar</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>ScrollTo</i>	Scrolls to the given position. (Inherited from <i>SapScrollbar</i> )
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SapWindow Class

## Description

SapWindow class is the class for a top-level window.

## Inheritance Hierarchy

- [SapComponent](#)
  - SapWindow

## Syntax

```
'Declaration
Public Class SapWindow _
Inherits SapComponent _
Implements IMoveable
```

## Properties

Name	Description
<a href="#">AccessibilityText</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTextOnRequest</a>	an additional text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">AccessibilityTooltip</a>	an additional tooltip text for accessibility support. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ButtonbarVisible</a>	whether the application toolbar, the lower toolbar within SAP GUI, is visible.
<a href="#">Changeable</a>	whether an object is changeable. (Inherited from <a href="#">SapComponent</a> )
<a href="#">DefaultTooltip</a>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <a href="#">SapComponent</a> )
<a href="#">GuiFocus</a>	the element within SAP GUI that currently has the focus.
<a href="#">Height</a>	the current height of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IconName</a>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <a href="#">SapComponent</a> )
<a href="#">IsSymbolFont</a>	whether the component's text is visualized in the SAP symbol font. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Left</a>	the left position of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Modified</a>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Name</a>	the name of the component. (Inherited from <a href="#">SapComponent</a> )

Name	Description
<a href="#">ScreenLeft</a>	the left position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">ScreenTop</a>	the top position of the component in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">StatusbarVisible</a>	whether the statusbar is visible.
<a href="#">SystemFocus</a>	the element within SAP GUI that has the focus from the server application's perspective.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">TitlebarVisible</a>	whether the titlebar is visible.
<a href="#">ToolbarVisible</a>	whether the toolbar is visible.
<a href="#">Tooltip</a>	the tooltip text. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Top</a>	the top coordinate of the element in screen coordinates. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	the current width of the component. (Inherited from <a href="#">SapComponent</a> )
<a href="#">WindowHandle</a>	the window handle of the control that is connected to the GuiShell.
<a href="#">WindowState</a>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <a href="#">IMoveable</a> )
<a href="#">WorkingPaneHeight</a>	the current height of the working pane.
<a href="#">WorkingPaneWidth</a>	the current width of the working pane.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Close</a>	Closes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">CloseSynchron</a>	Closes the window and waits until the window is closed. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetCloseWindows</i></a>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetFocus</i></a>	Returns the object with the input focus. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetNextCloseWindow</i></a>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <a href="#"><i>IMoveable</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">IsActive</a>	Returns whether the window is set to active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">IsVkeyAllowed</a>	The method returns True if the given virtual key can be executed on the current screen.
<a href="#">JumpBackward</a>	Execute the Ctrl+Shift+Tab key on the window to jump backward one block.
<a href="#">JumpForward</a>	Execute the Ctrl+Tab key on the window to jump forward one block.
<a href="#">Maximize</a>	Maximizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Minimize</a>	Reduces the window to an icon. (Inherited from <a href="#">IMoveable</a> )
<a href="#">Move</a>	Moves the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">ResizeWorkingPane</a>	The ResizeWorkingPane function will resize the window so that the available working area has the given width and height in character metric.
<a href="#">ResizeWorkingPaneEx</a>	The ResizeWorkingPaneEx function will resize the window so that the available working area has the given width and height in pixels.
<a href="#">Restore</a>	Restores the window to its previous size. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SendVKey</a>	Send a virtual key to the system.
<a href="#">SetActive</a>	Makes the window active. (Inherited from <a href="#">IMoveable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">ShowContextMenu</a>	Shows the context menu of the control. (Inherited from <a href="#">SapComponent</a> )
<a href="#">Size</a>	Resizes the window. (Inherited from <a href="#">IMoveable</a> )
<a href="#">TabBackward</a>	Execute the Shift+Tab key on the window to jump backward one element.
<a href="#">TabForward</a>	Execute the Tab key on the window to jump forward one element.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForDisappearance</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Silverlight Class Reference

Lists the available classes for testing Silverlight controls.

### SLApplication Class

#### Description

The container for Silverlight controls.

#### Inheritance Hierarchy

- [SLBase](#)

- SLApplication

## Syntax

```
'Declaration
Public Class SLApplication _
Inherits SLBase
```

## Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i> )
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLAutoCompleteBox Class

### Description

Represents a control that provides a text box for user input and a drop-down that contains possible matches based on the input in the text box.

### Inheritance Hierarchy

- [SLBase](#)
  - SLAutoCompleteBox

### Syntax

```
'Declaration
Public Class SLAutoCompleteBox _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HorizontallyScrollable</a>	a value that indicates whether the combo box can scroll horizontally.
<a href="#">HorizontalScrollPercent</a>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.

Name	Description
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsOpen</a>	a value that indicates whether the auto complete box is open
<a href="#">Items</a>	a list containing items of the current matches. If nothing was entered in the control's text box an empty list is returned.
<a href="#">ItemTexts</a>	a list containing the texts of the current matches. If nothing was entered in the control's text box an empty list is returned.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticallyScrollable</a>	a value that indicates whether the combo box can scroll vertically.
<a href="#">VerticalScrollPercent</a>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the drop-down list that contains the matches if it is currently open.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollHorizontal</a>	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
<a href="#">ScrollVertical</a>	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
<a href="#">Select</a>	Types the given text into the auto box complete box and selects a match.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetHorizontalScrollPercent</a>	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetVerticalScrollPercent</a>	Sets the vertical scroll position as a percentage of the total content area within the combo box.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLBase Class

### Description

Provides a Silverlight framework-level set of properties, events, and methods for Silverlight elements.

### Inheritance Hierarchy

## Syntax

```
'Declaration
Public Class SLBase _
```

Inherits `TestObject` \_  
Implements `IClickable`, `IFocusable`, `IKeyable`

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element.
<a href="#">ClassName</a>	the simple class name of the element.
<a href="#">ControlType</a>	a string containing the control type for the element.
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element.
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled.
<a href="#">Name</a>	a string containing the UI Automation name for the element.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type.
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLButton Class

### Description

Identifies a button control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLButton

### Syntax

```
'Declaration
Public Class SLButton _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLCalendar Class

### Description

Identifies a calendar control.

### Inheritance Hierarchy

- [SLBase](#)
  - `SLCalendar`

## Syntax

```
'Declaration
Public Class SLCalendar _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">CanSelectMultiple</a>	whether multiple dates can be selected
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">DisplayMode</a>	a value that indicates whether the calendar displays a month, year, or decade.
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelectionRequired</a>	whether at least one date has to be selected
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">SelectedDate</a>	the currently selected date in the currently displayed view.
<a href="#">SelectedDates</a>	a list of selected dates in the currently displayed view.
<a href="#">SupportedDisplayModes</a>	a list of supported display modes.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SelectDate</a>	Selects the given date.
<a href="#">SelectDates</a>	Selects the given dates.
<a href="#">SelectRange</a>	Selects a range of dates.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SwitchToDecadeView</a>	Switches the calendar display mode to 'decade', if supported.
<a href="#">SwitchToMonthView</a>	Switches the calendar display mode to 'month', if supported.
<a href="#">SwitchToYearView</a>	Switches the calendar display mode to 'year', if supported.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<a href="#">WaitForObject</a>	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLCalendarButton Class

### Description

Identifies a calendar button.

### Inheritance Hierarchy

- [SLBase](#)
  - SLCalendarButton

### Syntax

```
'Declaration
Public Class SLCalendarButton _
Inherits SLBase
```

## Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i> )
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>IsSelected</i>	a value that indicates whether the calendar button is selected
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. <i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Clicks the button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLCalendarDayButton Class

### Description

Identifies a calendar day button.

### Inheritance Hierarchy

- [SLBase](#)
  - SLCalendarDayButton

### Syntax

```
'Declaration
Public Class SLCalendarDayButton _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the calendar day button is selected
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Clicks the button.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLCheckBox Class

### Description

Identifies a check box control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLCheckBox

## Syntax

```
'Declaration  
Public Class SLCheckBox _  
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToggleState</a>	the toggle state of the check box
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetIndeterminate</i></a>	Set the check box to the indeterminate state.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Toggle</i></a>	Cycles through the toggle states of the check box in this order: On, Off and, if supported, Indeterminate.
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>Uncheck</i></a>	Unchecks the check box.
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLComboBox Class

### Description

Identifies a combo box control.

Combo boxes in Silverlight require to be opened once before information about their items can be retrieved.

### Inheritance Hierarchy

- [SLBase](#)
  - SLComboBox

### Syntax

```
'Declaration
Public Class SLComboBox _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HorizontallyScrollable</a>	a value that indicates whether the combo box can scroll horizontally.
<a href="#">HorizontalScrollPercent</a>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsOpen</a>	a value that indicates whether the combo box is open
<a href="#">Items</a>	a complete list of items.
<a href="#">ItemTexts</a>	a complete list of item texts.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">SelectedIndex</a>	the index of the selected item or negative one (-1) if the selection is empty.
<a href="#">SelectedItem</a>	the selected item or <code>Nothing</code> if the selection is empty.
<a href="#">SelectedItemText</a>	the text of the selected item or an empty string if the selection is empty.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticallyScrollable</a>	a value that indicates whether the combo box can scroll vertically.
<a href="#">VerticalScrollPercent</a>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Close</a>	Closes the combo box.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Open</a>	Opens the combo box.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollHorizontal</a>	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
<a href="#">ScrollVertical</a>	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
<a href="#">Select</a>	Selects an item in the combo box.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetHorizontalScrollPercent</a>	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetVerticalScrollPercent</a>	Sets the vertical scroll position as a percentage of the total content area within the combo box.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Selects the combo box item.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLDataGrid Class

### Description

Identifies a data grid control.

If the data grid has a vertical scroll bar, rows which are not in the visible area of the data grid do not expose any information (e.g. text, caption). In order to interact with such a row or retrieve information about the row it needs to be scrolled into view first.

### Inheritance Hierarchy

- [SLBase](#)
  - SLDataGrid

### Syntax

```
'Declaration
Public Class SLDataGrid _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">CanSelectMultiple</a>	whether the data grid allows more than one row to be selected concurrently.

Name	Description
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ColumnCount</i>	the number of columns in the data grid
<i>ColumnHeaders</i>	a list containing the header item for every column
<i>ColumnHeaderTexts</i>	a list containing the text of the header item for every column
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>HorizontallyScrollable</i>	a value that indicates whether the data grid can scroll horizontally.
<i>HorizontalScrollPercent</i>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>RowCount</i>	the number of rows in the data grid
<i>Rows</i>	a list of rows in the data grid
<i>RowTexts</i>	a list of row texts in the data grid. The text for every row is returned as a string that contains the text of every cell separated with a blank character.
<i>SelectedCell</i>	the currently selected cell or <i>Nothing</i> if no cell is selected
<i>SelectedCellText</i>	the text of the currently selected cell or an empty string if no cell is selected
<i>SelectedRow</i>	the currently selected row or <i>Nothing</i> if no row is selected
<i>SelectedRows</i>	a list of currently selected rows or an empty list if no row is selected
<i>SelectedRowText</i>	the text of the currently selected row or an empty string if no row is selected
<i>SelectedRowTexts</i>	the text of the currently selected rows or an empty list if no row is selected
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )
<i>VerticallyScrollable</i>	a value that indicates whether the data grid can scroll vertically.
<i>VerticalScrollPercent</i>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollHorizontal</a>	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
<a href="#">ScrollIntoView</a>	Scrolls the specified row or cell into view.
<a href="#">ScrollVertical</a>	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
<a href="#">Select</a>	Selects the specified row.
<a href="#">SelectCell</a>	Selects the specified cell.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetHorizontalScrollPercent</a>	Sets the horizontal scroll position as a percentage of the total content area within the data grid.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetVerticalScrollPercent</a>	Sets the vertical scroll position as a percentage of the total content area within the data grid.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SLDataGridCell Class

## Description

Identifies a cell within a row of a data grid control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLDataGridCell

## Syntax

```
'Declaration
Public Class SLDataGridCell _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the cell is selected
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLDataGridDetails Class

### Description

Identifies a control that displays additional details within a data grid row.

### Inheritance Hierarchy

- [SLBase](#)
  - SLDataGridDetails

### Syntax

```
'Declaration
Public Class SLDataGridDetails _
Inherits SLBase
```

## Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i> )
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLDataGridRow Class

### Description

Identifies a row in data grid.

### Inheritance Hierarchy

- [SLBase](#)
  - SLDataGridRow

### Syntax

```
'Declaration
Public Class SLDataGridRow _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Cells</a>	the cells of the data grid row.
<a href="#">CellTexts</a>	the text of the cells of the data grid row.
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the row is selected.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">RowHeader</a>	the header for this row
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the row into view.
<a href="#">Select</a>	Selects the row
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLDataPager Class

### Description

Identifies a data pager for paging through a collection of data.

## Inheritance Hierarchy

- [SLBase](#)
  - SLDataPager

## Syntax

```
'Declaration
Public Class SLDataPager _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">CurrentPage</a>	The current page.
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">PageCount</a>	The count of the pages.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i> )
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i> )
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">MoveToFirstPage</a>	Moves the data pager to the first page.
<a href="#">MoveToLastPage</a>	Moves the data pager to the last page.
<a href="#">MoveToNextPage</a>	Moves the data pager to the next page.
<a href="#">MoveToPage</a>	Moves the data pager to the given page.
<a href="#">MoveToPreviousPage</a>	Moves the data pager to the previous page.
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

## SLDatePicker Class

### Description

Represents a control that allows the user to select a date.

### Inheritance Hierarchy

- [SLBase](#)
  - SLDatePicker

### Syntax

```
'Declaration
Public Class SLDatePicker _
Inherits SLBase
```

## Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i> )
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsCalendarOpen</i>	a value whether the drop-down Calendar is open.
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>SelectedDate</i>	the selected date or <i>Nothing</i> if no date is selected.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>CloseCalendar</i>	Closes the drop-down Calendar.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenCalendar</a>	Opens the drop-down Calendar.

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLDescriptionViewer Class

### Description

Identifies a description viewer control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLDescriptionViewer

### Syntax

```
'Declaration
Public Class SLDescriptionViewer _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as

Name	Description
	children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i> )
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i> )
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i> )
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i> )
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLFrame Class

### Description

Identifies a frame control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLFrame

## Syntax

```
'Declaration
Public Class SLFrame _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

## SLGridSplitter Class

### Description

Identifies a grid splitter control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLGridSplitter

### Syntax

```
'Declaration
Public Class SLGridSplitter _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>MoveHorizontal</i></a>	Moves the splitter horizontally.
<a href="#"><i>MoveVertical</i></a>	Moves the splitter vertically.
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLGroup Class

### Description

Identifies a group control, which acts as a container for other controls.

### Inheritance Hierarchy

- [SLBase](#)
  - SLGroup

### Syntax

```
'Declaration
Public Class SLGroup _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<a href="#">WaitForObject</a>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )  Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLHeader Class

### Description

Identifies a control that provides a visual container for the labels for rows or columns.

### Inheritance Hierarchy

- [SLBase](#)
  - SLHeader

### Syntax

```
'Declaration
Public Class SLHeader _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HeaderItems</a>	a list containing the header items of this header control
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLHeaderItem Class

### Description

Identifies a control that provides a visual label for a row or column.

### Inheritance Hierarchy

- [SLBase](#)
  - SLHeaderItem

### Syntax

```
'Declaration
Public Class SLHeaderItem _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects the header item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLHorizontalScrollBar Class

### Description

Identifies a horizontal scroll bar.

### Inheritance Hierarchy

- [SLBase](#)
  - `SLHorizontalScrollBar`

## Syntax

```
'Declaration
Public Class SLHorizontalScrollBar _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Maximum</a>	the maximum scroll position
<a href="#">Minimum</a>	the minimum scroll position
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ScrollPosition</a>	the current scroll position
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Scroll</a>	Scrolls the scroll bar by the specified amount
<a href="#">ScrollToMaximum</a>	Scrolls the scroll bar to the right end.
<a href="#">ScrollToMinimum</a>	Scrolls the scroll bar to the left end.
<a href="#">ScrollToPosition</a>	Scrolls the scroll bar to the specific position
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLHyperlinkButton Class

### Description

Identifies a hyperlink button control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLHyperlinkButton

### Syntax

```
'Declaration
Public Class SLHyperlinkButton _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Clicks the hyperlink button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLImage Class

### Description

Identifies an image control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLImage

### Syntax

```
'Declaration
Public Class SLImage _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLListBox Class

### Description

Identifies a list box control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLListBox

### Syntax

```
'Declaration
Public Class SLListBox _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">CanSelectMultiple</a>	whether the list box allows more than one child element to be selected concurrently.
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HorizontallyScrollable</a>	a value that indicates whether the list box can scroll horizontally.
<a href="#">HorizontalScrollPercent</a>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Items</a>	the list of list box items.
<a href="#">ItemTexts</a>	the list of all item texts.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">SelectedIndex</a>	the index of the first item in the current selection or returns negative one (-1) if the selection is empty.
<a href="#">SelectedIndices</a>	the indices of the currently selected items. An empty list is returned if no items are currently selected.
<a href="#">SelectedItem</a>	the first item in the current selection or returns <code>Nothing</code> if the selection is empty
<a href="#">SelectedItems</a>	the currently selected items. An empty list is returned, if no items are currently selected.
<a href="#">SelectedItemText</a>	the text of the first selected item.
<a href="#">SelectedItemTexts</a>	the texts of the currently selected items. An empty list is returned if no items are currently selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticallyScrollable</a>	a value that indicates whether the list box can scroll vertically.
<a href="#">VerticalScrollPercent</a>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a>)</p>
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DeselectAll</a>	Deselects all list items.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollHorizontal</a>	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
<a href="#">ScrollVertical</a>	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
<a href="#">Select</a>	Selects the given list box item.
<a href="#">SelectAll</a>	Selects all items in the list.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetHorizontalScrollPercent</a>	Sets the horizontal scroll position as a percentage of the total content area within the list box.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetVerticalScrollPercent</a>	Sets the vertical scroll position as a percentage of the total content area within the list box.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SLListItem Class

## Description

Identifies a list item control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLListItem

## Syntax

```
'Declaration  
Public Class SLListItem _  
Inherits SLBase
```

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the list item is selected
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Deselect</a>	Deselects the item.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scroll the list item into view.
<a href="#"><i>Select</i></a>	Selects the list item.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLMediaElement Class

### Description

Represents a control that contains audio and/or video.

### Inheritance Hierarchy

- [SLBase](#)
  - `SLMediaElement`

### Syntax

```
'Declaration
Public Class SLMediaElement _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLMenu Class

### Description

Identifies a menu control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLMenu

### Syntax

```
'Declaration
Public Class SLMenu _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLMenuBar Class

### Description

Identifies a menu bar control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLMenuBar

## Syntax

```
'Declaration
Public Class SLMenuBar _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )

An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLMenuItem Class

### Description

Identifies a menu item control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLMenuItem

### Syntax

```
'Declaration
Public Class SLMenuItem _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLMultiScaleImage Class

### Description

Enables users to open a multi-resolution image, which can be zoomed in on and panned across.

### Inheritance Hierarchy

- [SLBase](#)
  - `SLMultiScaleImage`

## Syntax

```
'Declaration
Public Class SLMultiScaleImage _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLPane Class

### Description

Identifies a pane that can optionally have scroll bars.

### Inheritance Hierarchy

- [SLBase](#)
  - SLPane

### Syntax

```
'Declaration
Public Class SLPane _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HorizontallyScrollable</a>	a value that indicates whether the pane can scroll horizontally.
<a href="#">HorizontalScrollPercent</a>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticallyScrollable</a>	a value that indicates whether the pane can scroll vertically.
<a href="#">VerticalScrollPercent</a>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollHorizontal</i></a>	Scrolls the currently visible region of the content area, horizontally, the specified <a href="#"><i>ScrollAmount</i></a> .
<a href="#"><i>ScrollVertical</i></a>	Scrolls the currently visible region of the content area, vertically, the specified <a href="#"><i>ScrollAmount</i></a> .
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#"><i>SetHorizontalScrollPercent</i></a>	Sets the horizontal scroll position as a percentage of the total content area within the pane.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetVerticalScrollPercent</i></a>	Sets the vertical scroll position as a percentage of the total content area within the pane.
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLPasswordBox Class

### Description

Identifies a password box control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLPasswordBox

### Syntax

```
'Declaration
Public Class SLPasswordBox _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsReadOnly</a>	whether the password box is read-only
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all text from the password field.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetPosition</i></a>	Sets the insertion point in the password field.
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>SetSelection</i></a>	Selects a range of text in the password box.
<a href="#"><i>SetText</i></a>	Replaces the text in the password field with the given text.
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLPopup Class

### Description

Identifies a popup control. Context menus are also treated as popup controls.

## Inheritance Hierarchy

- [SLBase](#)
  - SLPopup

## Syntax

```
'Declaration  
Public Class SLPopup _  
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if an object exists in the application under test. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Find</i></a>	Finds an object specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>FindAll</i></a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GenerateLocator</i></a>	Returns a locator for this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLProgressBar Class

### Description

Identifies a progress bar control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLProgressBar

### Syntax

```
'Declaration
Public Class SLProgressBar _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Maximum</i>	the maximum progress value
<i>Minimum</i>	the minimum progress value
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLRadioButton Class

### Description

Represents a button that allows a user to select a single option from a group of options.

### Inheritance Hierarchy

- [SLBase](#)
  - SLRadioButton

### Syntax

```
'Declaration
Public Class SLRadioButton _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the radio button is selected.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Deselects any selected items and then selects the current element.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLRepeatButton Class

### Description

Identifies a repeat button control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLRepeatButton

### Syntax

```
'Declaration
Public Class SLRepeatButton _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Clicks the button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLRichTextBox Class

### Description

Identifies a rich text box control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLRichTextBox

### Syntax

```
'Declaration
Public Class SLRichTextBox _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">SelectedText</a>	the selected text
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all text from the text box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as

Name	Description
	children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i> )
<i>SetPosition</i>	Sets the insertion point in the text box.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i> )
<i>SetSelection</i>	Selects a range of text in the text box.
<i>SetText</i>	Replaces the content in the text box with the given text.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# SLSeparator Class

## Description

Identifies a separator control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLSeparator

## Syntax

```
'Declaration
Public Class SLSeparator _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. <a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLSlider Class

### Description

Identifies a progress bar control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLSlider

### Syntax

```
'Declaration
Public Class SLSlider _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>LargeChange</i>	the value that is added to or subtracted from the Value property when a large change is made, such as with the PAGE DOWN key.
<i>Maximum</i>	the maximum progress value
<i>Minimum</i>	the minimum progress value
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>SmallChange</i>	the value that is added to or subtracted from the Value property when a small change is made, such as with an arrow key.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DecreaseLarge</i>	Decreases the value of the Slider by a large amount.
<i>DecreaseSmall</i>	Decreases the value of the Slider by a small amount.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">IncreaseLarge</a>	Increases the value of the Slider by a large amount.
<a href="#">IncreaseSmall</a>	Increases the value of the Slider by a small amount.
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetValue</a>	Sets the value of the slider
<a href="#">SetValueToMaximum</a>	Sets the Slider to the maximum position.
<a href="#">SetValueToMinimum</a>	Sets the Slider to the minimum position.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLSpinner Class

### Description

Identifies a spinner control.

A spinner control type consists of a set of buttons that enable a user to select from a set of items or set a numerical value from within a range.

### Inheritance Hierarchy

- [SLBase](#)
  - SLSpinner

### Syntax

```
'Declaration
Public Class SLSpinner _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>NumericValue</i>	the current numeric value of the spinner
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLSplitButton Class

### Description

Identifies a split button control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLSplitButton

### Syntax

```
'Declaration
Public Class SLSplitButton _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLStatusBar Class

### Description

Identifies a status bar control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLStatusBar

### Syntax

```
'Declaration
Public Class SLStatusBar _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. ## SLTabControl Class

### Description

Identifies a tab control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTabControl

### Syntax

```
'Declaration
Public Class SLTabControl _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Items</a>	a complete list of tab items.
<a href="#">ItemTexts</a>	a complete list of tab item texts.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">SelectedIndex</a>	the index of the selected item or negative one (-1) if the selection is empty.
<a href="#">SelectedItem</a>	the selected item or <code>Nothing</code> if the selection is empty.

Name	Description
<a href="#">SelectedItemText</a>	the text of the selected item or an empty string if the selection is empty.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects an item in the tab control.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForObject</i></a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForProperty</i></a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForPropertyNotEquals</i></a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForScreenshotStable</i></a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

# SLSLItem Class

## Description

Identifies a tab item control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLSLItem

## Syntax

```
'Declaration  
Public Class SLSLItem _  
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsSelected</a>	a value that indicates whether the tab item is selected
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Select</i></a>	Selects the tab item.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTable Class

### Description

Identifies a table.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTable

### Syntax

```
'Declaration
Public Class SLTable _
Inherits SLBase
```

## Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i> )
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i> )
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTextBlock Class

### Description

Identifies a control for displaying small amounts of flow content.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTextBlock

### Syntax

```
'Declaration
Public Class SLTextBlock _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTextBox Class

### Description

Identifies a text box control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTextBox

## Syntax

```
'Declaration
Public Class SLTextBox _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsReadOnly</a>	whether the text box is read-only
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <a href="#">System.Drawing.Imaging.PixelFormat.Format32bppRgb</a> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Clear</a>	Removes all text from the text field.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetPosition</a>	Sets the insertion point in the text field.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetSelection</a>	Selects a range of text in the text box.
<a href="#">SetText</a>	Replaces the text in the text field with the given text.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<a href="#">WaitForObject</a>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Examples

```
textBox.SetText("some text")
textBox.SetSelection(0, 4) ' selects 4 characters starting from the first one
textBox.TypeKeys("<Ctrl+C>") ' copies the selected text to the clipboard
Dim selectedText = Clipboard.GetText() ' gets the text from the clipboard
```

# SLThumb Class

## Description

Identifies a thumb control.

## Inheritance Hierarchy

- [SLBase](#)
  - SLThumb

## Syntax

```
'Declaration
Public Class SLThumb _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i> )
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i> )
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i> )
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i> )
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i> )
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i> )

## Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i> )
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i> )
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i> )
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i> )
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i> )
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i> )
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i> )
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i> )
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. <a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTitleBar Class

### Description

Identifies the caption bar on a window.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTitleBar

### Syntax

```
'Declaration
Public Class SLTitleBar _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

### Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLToggleButton Class

### Description

Identifies a toggle button control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLToggleButton

### Syntax

```
'Declaration
Public Class SLToggleButton _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToggleState</a>	the toggle state of the button
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Cycles through the toggle states of the button in this order: On, Off and, if supported, Indeterminate.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLToolBar Class

### Description

Identifies a toolbar control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLToolBar

### Syntax

```
'Declaration
Public Class SLToolBar _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTreeView Class

### Description

Represents a control that displays hierarchical data in a tree structure that has items that can expand and collapse.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTreeView

### Syntax

```
'Declaration
Public Class SLTreeView _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HorizontallyScrollable</a>	a value that indicates whether the tree view can scroll horizontally.
<a href="#">HorizontalScrollPercent</a>	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">RootItems</a>	a complete list of all root tree items.
<a href="#">RootItemTexts</a>	a complete list of the texts of all root tree items.
<a href="#">SelectedItem</a>	the selected item or returns <code>Nothing</code> if the selection is empty.
<a href="#">SelectedItemPath</a>	the selected item path or an empty item path if nothing is selected
<a href="#">SelectedItemText</a>	the text of the selected item or an empty string if the selection is empty.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">VerticallyScrollable</a>	a value that indicates whether the tree view can scroll vertically.
<a href="#">VerticalScrollPercent</a>	the current vertical scroll position or negative one (-1) if there is no valid scroll position.
<a href="#">VisibleItemPaths</a>	the visible items in the tree as item paths.

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Collapse</a>	Collapses the specified item.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands the specified item.
<a href="#">ExpandAll</a>	Expands all items in the tree.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollHorizontal</a>	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
<a href="#">ScrollVertical</a>	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
<a href="#">Select</a>	Selects the specified item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetHorizontalScrollPercent</a>	Sets the horizontal scroll position as a percentage of the total content area within the tree view.
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">SetVerticalScrollPercent</a>	Sets the vertical scroll position as a percentage of the total content area within the tree view.
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLTreeViewItem Class

### Description

Represents a selectable item in a tree control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLTreeViewItem

### Syntax

```
'Declaration
Public Class SLTreeViewItem _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsExpanded</a>	a value that indicates whether the nested items in a tree item are expanded or collapsed.
<a href="#">IsLeaf</a>	a value that indicates whether the tree view item is a leaf item.
<a href="#">IsSelected</a>	a value that indicates whether a tree item is selected.
<a href="#">Items</a>	a complete list of items.
<a href="#">ItemTexts</a>	a complete list of item texts.
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Collapse</a>	Collapses the item.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Expand</a>	Expands the item.
<a href="#">ExpandSubTree</a>	Expands the sub tree under this tree item.
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the tree item into view
<a href="#">Select</a>	Selects the item.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLValidationSummary Class

### Description

Identifies a validation summary control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLValidationSummary

### Syntax

```
'Declaration
Public Class SLValidationSummary _
Inherits SLBase
```

### Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )

Name	Description
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as

Name	Description
	children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i> )
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i> )
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i> )
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i> )
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i> )
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i> )
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i> )
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i> )
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i> )
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i> )
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i> )
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i> )
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i> )
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i> )
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i> )
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i> )
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i> )
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLVerticalScrollBar Class

### Description

Identifies a vertical scroll bar.

## Inheritance Hierarchy

- [SLBase](#)
  - SLVerticalScrollBar

## Syntax

```
'Declaration
Public Class SLVerticalScrollBar _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Maximum</a>	the maximum scroll position
<a href="#">Minimum</a>	the minimum scroll position
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ScrollPosition</a>	the current scroll position
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRawChildren</a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#">SLBase</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Scroll</a>	Scrolls the scroll bar by the specified amount
<a href="#">ScrollToMaximum</a>	Scrolls the scroll bar to the bottom.
<a href="#">ScrollToMinimum</a>	Scrolls the scroll bar to the top.
<a href="#">ScrollToPosition</a>	Scrolls the scroll bar to the specific position
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## SLWindow Class

### Description

Identifies a window control.

### Inheritance Hierarchy

- [SLBase](#)
  - SLWindow

### Syntax

```
'Declaration
Public Class SLWindow _
Inherits SLBase
```

## Properties

Name	Description
<a href="#">AutomationId</a>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ClassName</a>	the simple class name of the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">ControlType</a>	a string containing the control type for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">HelpText</a>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">IsEnabled</a>	a value that indicates whether the element is enabled. (Inherited from <a href="#">SLBase</a> )
<a href="#">Name</a>	a string containing the UI Automation name for the element. (Inherited from <a href="#">SLBase</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Close</a>	Closes the window.
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>GetChildren</i></a>	Returns the child objects of this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetDynamicMethodList</i></a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetParent</i></a>	Looks up the parent of this object in the test application. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetProperty</i></a>	Returns the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetPropertyList</i></a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>GetRawChildren</i></a>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <a href="#"><i>SLBase</i></a> )
<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>Move</i></a>	Moves the window.
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Java AWT and Swing Class Reference

Lists the available classes for testing Java AWT and Swing controls.

### AbstractButton Class

#### Description

Defines common behaviors for buttons and menu items.

#### Inheritance Hierarchy

- [JComponent](#)
  - AbstractButton
    - [JButton](#)
    - [JMenuItem](#)
    - [JToggleButton](#)

#### Syntax

```
'Declaration
Public Class AbstractButton _
Inherits JComponent
```

#### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">ToolTipText</a>	the tool tip text of a Swing component. (Inherited from <a href="#">JComponent</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )

Name	Description
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Select</a>	Selects the button.
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## Applet Class

### Description

Represents the Java Applet in the browser.

### Inheritance Hierarchy

- [AWTContainer](#)
  - Applet

### Syntax

```
'Declaration
Public Class Applet _
Inherits AWTContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )

Name	Description
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )

Name	Description
<a href="#"> SetProperty </a>	Sets the value of the specified property. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextCapture </a>	Returns the text in this object's visible area. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextClick </a>	Clicks in the center of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextExists </a>	Returns whether the specified text exists. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TextRectangle </a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> TypeKeys </a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> TypePasswordKeys </a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"> IKeyable </a> )
<a href="#"> WaitForChildDisappearance </a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForDisappearance </a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForObject </a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForProperty </a>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForPropertyNotEquals </a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"> TestObject </a> )
<a href="#"> WaitForScreenshotStable </a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AppletContainer Class

### Description

Root element of an Applet in the browser.

### Inheritance Hierarchy

- [AWTContainer](#)
  - AppletContainer

### Syntax

```
'Declaration
Public Class AppletContainer _
Inherits AWTContainer
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. <a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <a href="#"><i>TestObject</i></a> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>Select</i></a>	Selects the button.
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )

Name	Description
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTCanvas Class

### Description

Represents an empty rectangular area of the screen where the application can draw or trap events from the user.

### Inheritance Hierarchy

- [AWTComponent](#)

- `AWTCanvas`

## Syntax

```
'Declaration
Public Class AWTCanvas _
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>MouseMove</i></a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>OpenContextMenu</i></a>	Opens a context menu at the specified position. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>PressKeys</i></a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>PressMouse</i></a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ReleaseKeys</i></a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>ReleaseMouse</i></a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#"><i>IClickable</i></a> )
<a href="#"><i>ScrollIntoView</i></a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#"><i>AWTComponent</i></a> )
<a href="#"><i>SetFocus</i></a>	Gives focus to the control. (Inherited from <a href="#"><i>IFocusable</i></a> )
<a href="#"><i>SetProperty</i></a>	Sets the value of the specified property. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextCapture</i></a>	Returns the text in this object's visible area. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextClick</i></a>	Clicks in the center of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextExists</i></a>	Returns whether the specified text exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TextRectangle</i></a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>TypeKeys</i></a>	Sends a set of keystrokes to the object. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>TypePasswordKeys</i></a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#"><i>IKeyable</i></a> )
<a href="#"><i>WaitForChildDisappearance</i></a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>WaitForDisappearance</i></a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#"><i>TestObject</i></a> )

Name	Description
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTCheckbox Class

### Description

Represents a check box.

### Inheritance Hierarchy

- [AWTComponent](#)
  - AWTCheckbox

### Syntax

```
'Declaration
Public Class AWTCheckbox _
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Checked</a>	whether the check box is checked.
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )

Name	Description
<a href="#"><i>Exists</i></a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#"><i>TestObject</i></a> )

<a href="#"><i>GetRect</i></a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>HighlightObject</i></a>	Highlights this object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClick</i></a>	Clicks on specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageClickFile</i></a>	Clicks on the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExists</i></a>	Returns whether the specified image asset exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageExistsFile</i></a>	Returns whether the specified image exists. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangle</i></a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>ImageRectangleFile</i></a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>Invoke</i></a>	Dynamically invokes a method on the test object. (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>InvokeMethods</i></a>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <a href="#"><i>TestObject</i></a> )
<a href="#"><i>IsFocused</i></a>	Return whether the control has focus. (Inherited from <a href="#"><i>IFocusable</i></a> )

Name	Description
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">OpenContextMenu</a>	Opens a context menu at the specified position. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ScrollIntoView</a>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Toggles the check box state.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

## AWTCheckboxMenuItem Class

### Description

Represents a check box control that can be inserted in a menu item.

### Inheritance Hierarchy

- [AWTMenuItem](#)
  - AWTCheckboxMenuItem

### Syntax

```
'Declaration
Public Class AWTCheckboxMenuItem _
Inherits AWTMenuItem
```

### Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">Checked</a>	whether the check box of the menu item is checked.

Name	Description
<a href="#">Enabled</a>	Whether the menu item is enabled. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )

## Methods

Name	Description
<a href="#">CaptureBitmap</a>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <a href="#">TestObject</a> )
<a href="#">Check</a>	Checks the check box of the menu item.
<a href="#">Click</a>	Clicks on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">DoubleClick</a>	Double-clicks a mouse button on the object. (Inherited from <a href="#">IClickable</a> )
<a href="#">Exists</a>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <a href="#">TestObject</a> )
<a href="#">Exists</a>	Checks if an object exists in the application under test. (Inherited from <a href="#">TestObject</a> )
<a href="#">Find</a>	Finds an object specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">FindAll</a>	Finds all objects specified by an XPath locator. (Inherited from <a href="#">TestObject</a> )
<a href="#">GenerateLocator</a>	Returns a locator for this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetChildren</a>	Returns the child objects of this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetDynamicMethodList</a>	Returns a list of methods (including their signature) that can be dynamically invoked on this <a href="#">TestObject</a> . (Inherited from <a href="#">TestObject</a> )
<a href="#">GetParent</a>	Looks up the parent of this object in the test application. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetProperty</a>	Returns the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">GetPropertyList</a>	Returns a list of property names that can be retrieved for the given object. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">GetRect</a>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">HighlightObject</a>	Highlights this object. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClick</a>	Clicks on specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageClickFile</a>	Clicks on the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExists</a>	Returns whether the specified image asset exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageExistsFile</a>	Returns whether the specified image exists. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangle</a>	Returns the object-relative rectangle of the specified image asset. (Inherited from <a href="#">TestObject</a> )
<a href="#">ImageRectangleFile</a>	Returns the object-relative rectangle of the specified image. (Inherited from <a href="#">TestObject</a> )
<a href="#">Invoke</a>	Dynamically invokes a method on the test object. (Inherited from <a href="#">TestObject</a> )
<a href="#">InvokeMethods</a>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <a href="#">TestObject</a> )
<a href="#">IsFocused</a>	Return whether the control has focus. (Inherited from <a href="#">IFocusable</a> )
<a href="#">MouseMove</a>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">PressKeys</a>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">PressMouse</a>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">ReleaseKeys</a>	Releases a set of keys or mouse buttons. (Inherited from <a href="#">IKeyable</a> )
<a href="#">ReleaseMouse</a>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <a href="#">IClickable</a> )
<a href="#">Select</a>	Selects the menu item. (Inherited from <a href="#">AWTMenuItem</a> )
<a href="#">SetFocus</a>	Gives focus to the control. (Inherited from <a href="#">IFocusable</a> )
<a href="#">SetProperty</a>	Sets the value of the specified property. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextCapture</a>	Returns the text in this object's visible area. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextClick</a>	Clicks in the center of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">TextExists</a>	Returns whether the specified text exists. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">TextRectangle</a>	Returns the object-relative rectangle of the specified text. (Inherited from <a href="#">TestObject</a> )
<a href="#">Toggle</a>	Toggles the check box state of the menu item.
<a href="#">TypeKeys</a>	Sends a set of keystrokes to the object. (Inherited from <a href="#">IKeyable</a> )
<a href="#">TypePasswordKeys</a>	Types an encrypted password into an object, for example a text field. (Inherited from <a href="#">IKeyable</a> )
<a href="#">Uncheck</a>	Unchecks the check box of the menu item.
<a href="#">WaitForChildDisappearance</a>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForDisappearance</a>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForObject</a>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForProperty</a>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForPropertyNotEquals</a>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )
<a href="#">WaitForScreenshotStable</a>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <a href="#">TestObject</a> )

# AWTChoice Class

## Description

Represents a combo box.

## Inheritance Hierarchy

- [AWTComponent](#)
  - AWTChoice

## Syntax

```
'Declaration  
Public Class AWTChoice _  
Inherits AWTComponent
```

## Properties

Name	Description
<a href="#">AccessibleName</a>	The accessible name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">AccessibleRole</a>	The accessible role of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Background</a>	The background color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Cursor</a>	The name of the cursor set in the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Enabled</a>	whether the component is enabled. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Focusable</a>	whether the component can be focused. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Font</a>	The font of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Foreground</a>	The foreground color of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">Height</a>	The current height of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">ItemCount</a>	the number of items in the combo box.
<a href="#">Items</a>	the list of combo box items.
<a href="#">Name</a>	The name of the component. (Inherited from <a href="#">AWTComponent</a> )
<a href="#">NativeHandle</a>	The native window handle for the object. (Inherited from <a href="#">INativeWindow</a> )
<a href="#">SelectedIndex</a>	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected.
<a href="#">SelectedItem</a>	the selected item. NULL is returned, if no item is currently selected.
<a href="#">Text</a>	The text of the control. (Inherited from <a href="#">TestObject</a> )

Name	Description
<a href="#">Value</a>	The value of the control, e.g.: text in a text control. (Inherited from <a href="#">TestObject</a> )
<a href="#">Width</a>	The current width of the component. (Inherited from <a href="#">AWTComponent</a> )
